The Child Fatality Review Program State Panel

According to RSMo 210.195, "The Director of the Department of Social Services shall appoint a state child fatality review panel, which shall meet biannually to provide oversight and make recommendations to the Department of Social Services, State Technical Assistance Team." In this oversight role, the panel is encouraged to identify systemic problems and bring concerns to the attention of the State Technical Assistance Team. The composition of the State Panel mirrors that of the county panels; each multidisciplinary profession is represented by a recognized leader in the respective discipline.

 - Appendix Seven: Death Certificate Manner of Death 92

DEDICATION

This report reflects the work of many dedicated professionals throughout the state of Missouri. Through better understanding of how and why children die, we strive to improve and protect the lives of Missouri’s youngest citizens. We will always remember that each number represents a precious life lost. We dedicate this report to these children and their families.

MISSOURI CHILD FATALITY REVIEW PROGRAM

Child Fatality Review In Missouri

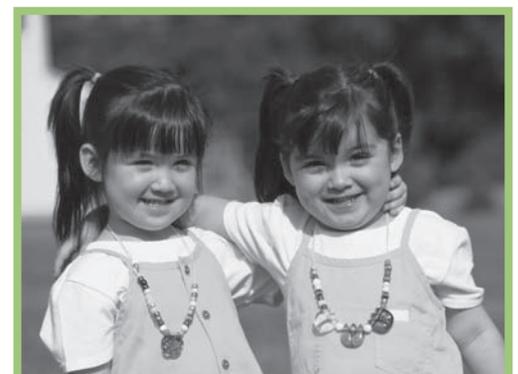

Death rates for infants, children and teens are widely recognized as valuable measures of child wellbeing, particularly when viewed within the context of two decades of demographic changes in our state. However, it is the accuracy of key factors associated with child deaths that provides the basis for identifying vulnerable children, and responding in ways that protect and improve their lives. Growing awareness, along with research in the late 1980's and early 1990's, showed that prevention or significant reductions of child abuse and neglect fatalities, as well as other serious and fatal injuries, could not be achieved without more complete information about how and why children are dying. It was widely acknowledged that many child abuse and neglect deaths were under-reported and/or misclassified. Scholars, professionals and other officials around the nation agreed that a system of comprehensive Child Death Review Teams could make a major difference.

In 1991, Missouri initiated the most comprehensive child fatality review system in the nation, designed to produce an accurate picture of each child death, as well as a database providing ongoing surveillance of all childhood fatalities. While the program has evolved and adapted to meet new challenges, the objectives have remained the same. The program identifies potentially fatal risks to infants and children, and responds with multi-level prevention strategies.

In Missouri, fatality data is collected through standardized forms and entered into a database. What is learned can be readily used by the community where the death occurred. The sum of statewide data is used to identify trends and patterns requiring system solutions. The Missouri Child Fatality Review Program (CFRP) has succeeded in remaining effective, relevant and sustainable over the past 18 years. The success of the program is due in large part, to the support of panel members, administrators and other professionals who volunteer for this difficult work, because they understand its importance. This work is a true expression of advocacy for children and families in our state.

The Missouri legislation requires that every county in our state (including the City of St. Louis) establish a multidisciplinary panel to examine the deaths of all children under the age of 18. If the death meets specific criteria, or if requested by the coroner/medical examiner, it is referred to the county's multidisciplinary CFRP panel. The minimum core panel for each county includes: Coroner/Medical Examiner, Law Enforcement, Juvenile/Family Court, Emergency Medical Services, Prosecutor, Public Health and Children's Division. Optional members may be added at the discretion of the panel. The panels do **not** act as investigative bodies. Their purpose is to enhance the knowledge base of the mandated investigators and to evaluate the potential service and prevention interventions for the family and community.

Of the average 1,100 child deaths annually in Missouri, approximately one-third merit review. To come under review, the cause of the child's death must be unclear, unexplained, or of a suspicious circumstance. All sudden, unexplained deaths of infants one week to one year of age, are required to be reviewed by the CFRP panel. (This is the only age group for which an autopsy is mandatory.)

STATE TECHNICAL ASSISTANCE TEAM AND CHILD FATALITY REVIEW PROGRAM

Missouri State Statutes

- Section 210.150 and 210.152 (Confidentiality and Reporting of Child Fatalities)
- Section 210.192 and 210.194 (Child Fatality Review Panels)
- Section 210.195 (State Technical Assistance Team - duties)
- Section 210.196 (Child Death Pathologists)
- Section 211.321; 219.061 (Accessibility of juvenile records for child fatality review)
- Section 194.117 (Sudden Infant Death; infant autopsies)
- Section 58.452 and 58.722 (Coroner/Medical Examiners responsibilities regarding child fatality review)

Confidentiality Issues (RSMo 210.192 to 210.196)

A proper Child Fatality Review Program (CFRP) review of a child death requires a thorough examination of all relevant data, including historical information concerning the deceased child and his/her family. Much of this information is protected from disclosure by law, especially medical and child abuse/neglect information. **Therefore, CFRP panel meetings are always closed to the public and cannot be lawfully conducted unless the public is excluded.** Each CFRP panel member should confine his or her public statements only to the fact that the panel met and that each panel member was charged to implement their own statutory mandates.

In no case, should any other information about the case or CFRP panel discussions be disclosed. All CFRP panel members who are asked to make a public statement should refer such inquiries to the panel spokesperson. Failure to observe this procedure may violate Children's Division regulations, as well as state and federal confidentiality statutes that contain penalties.

Individual disciplines (coroner/medical examiners, law enforcement agencies, prosecuting attorneys, etc.) can still make public statements consistent with their individual agency's participation in the investigation, as long as they do not refer to the specific details discussed at the CFRP panel meeting.

No CFRP panel member is prohibited from making public statements about the general purpose, nature or effects of the CFRP process. Panel members should also be aware that the legislation which established the CFRP panels provides official immunity to all panel participants.

WHEN A CHILD DIES

The loss of a loved one...particularly a child...is perhaps the greatest loss an individual or family can experience. Many overwhelming feelings follow the death of a child. This grief and sadness is a natural and normal reaction to an irreplaceable loss.

To better understand why and how our children die, the State of Missouri has implemented the Child Fatality Review Program. By reviewing child fatalities, we hope to identify causes and strategies that will ultimately lead to a reduction, in certain cases, of child fatalities. Missouri state law (RSMo 210.192) now requires that any child, birth through age 17, who dies from any cause, be reported to the coroner/medical examiner. The coroner/medical examiner is mandated to follow specific procedures concerning these fatalities. These include:

- All **sudden, unexplained** deaths of infants, from one week to one year, are required to be autopsied by a certified child-death pathologist. The most common questions for parents, "Why did our baby die?" can really only be answered by having an autopsy performed. During an autopsy, the internal organs are examined. This is done in a professional manner, so that the dignity of the child is maintained. The procedure will not prevent having an open casket at the funeral. Preliminary results may be available in a few days; however, the final report may take several weeks.
- In all other child deaths, the coroner/medical examiner may consult with a certified child-death pathologist regarding the circumstances of death. In some cases, an autopsy will be ordered.
- If the fatality meets certain criteria, the circumstances surrounding the death will be reviewed by the county Child Fatality Review Program panel. Facts regarding the death are discussed by the professionals who serve on the panel. The represented agencies on the panel have the responsibility to contribute information that will lead to a more accurate determination of the cause of death; they also try to identify ways to prevent further deaths from occurring. **All information is kept confidential.**

The Child Fatality Review Program is a true expression of child advocacy. Like you, we want to know why the death occurred. We will do everything we can to explain and help you understand why.

MISSOURI INCIDENT FATALITIES

*“A simple child, That lightly draws its breath,
And feels its life in every limb, What should it know of death?”
-William Wordsworth*

In reviewing this report, the reader should be aware of some important definitions and details about how child deaths are reported and certified in Missouri, summarized here: (Refer to Appendix 6, Definitions of Important Terms and Variables, for additional information.)

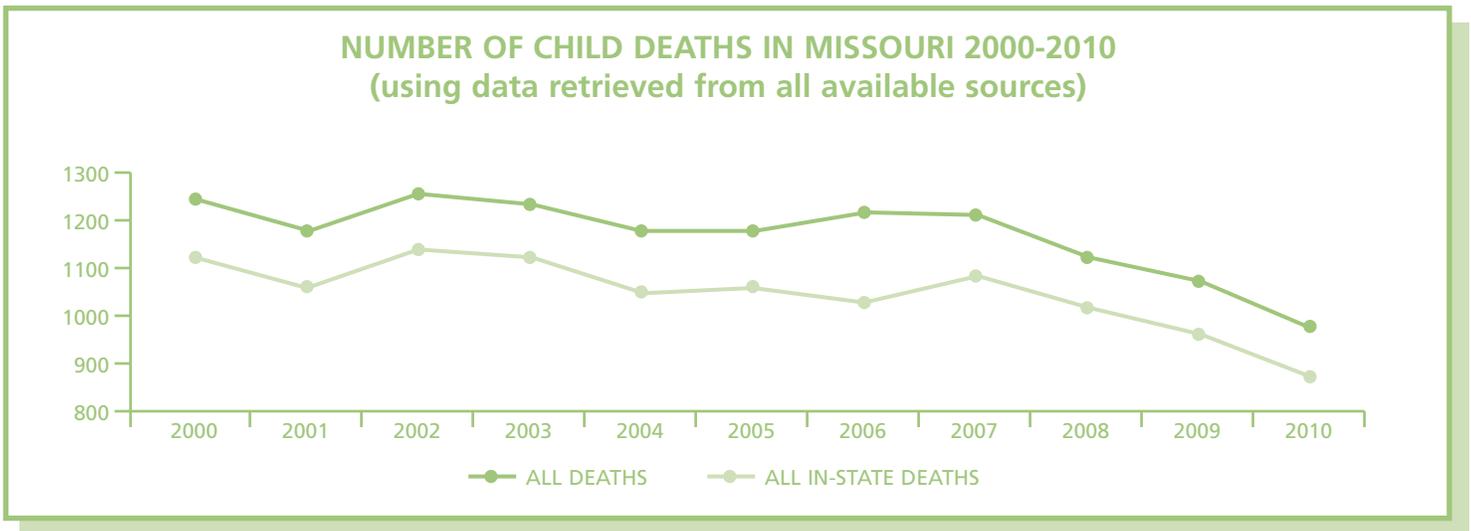

Missouri Child Fatalities refers to all children age 17 and under, who died in Missouri, without regard to the state of residence or the state in which the illness, injury or event occurred. (For example, a child who is a resident of Kentucky, injured in a motor vehicle crash in Illinois and is brought to a Missouri hospital, where he subsequently dies, would be considered as a “Missouri Child Fatality”. This death would be reported to the Child Fatality Review Program on a Data Form 1, Section A only, as an out-of-state event.)

Missouri Incident Fatality refers to a fatal illness, injury or event, which occurs within the state of Missouri. (This is not necessarily the county or state in which the child resided.) If the death meets the criteria for panel review, it is reviewed in the county in which the fatal injury, illness or event occurred.

Multiple-Cause Deaths: Cause of death is a disease, abnormality, injury or poisoning that contributed directly or indirectly to the death. However, a death often results from the combined effect of two or more conditions. Because the Child Fatality Review Program is focused on the prevention of child fatalities, the precipitating events are of particular concern. Therefore, deaths are categorized according to the circumstances of death, which may not be the immediate cause of death listed on the death certificate. (An example would be a child passenger in a car that runs off the road and lands in a ditch full of water; the “immediate cause of death” is listed on the death certificate as “drowning”, but the precipitating event was a motor vehicle crash. This death would be reported in the Motor Vehicle section; with a footnote indicating that the death certificate lists “drowning” as the immediate cause of death.)

- Every Missouri incident child fatality is required to be initially reviewed by the coroner/medical examiner and the chairperson for the county CFRP panel. The findings of this initial review are reported on the Data Form 1.
- Any child death that is *unclear, unexplained, or of a suspicious circumstance* and *all sudden unexpected deaths of infants one week to one year of age* are required to be reviewed by a county-based CFRP panel. Panel findings are reported on the Data Form 2. Panel members receive annual training on the investigation of child fatalities.
- The Child Fatality Review Program data management unit links data collected on the Data Forms 1 and 2, with the Department of Health and Senior Services birth and death data. Every attempt is made to reconcile the two systems; however, in some cases, crucial data components are incomplete and are noted, as appropriate.
- All deaths included in this CFRP Annual Report occurred in calendar year 2010. Some of the cases reviewed may not have been brought before a county panel until the year 2011.
- In some cases, panels did not complete all of the information requested on the data form.

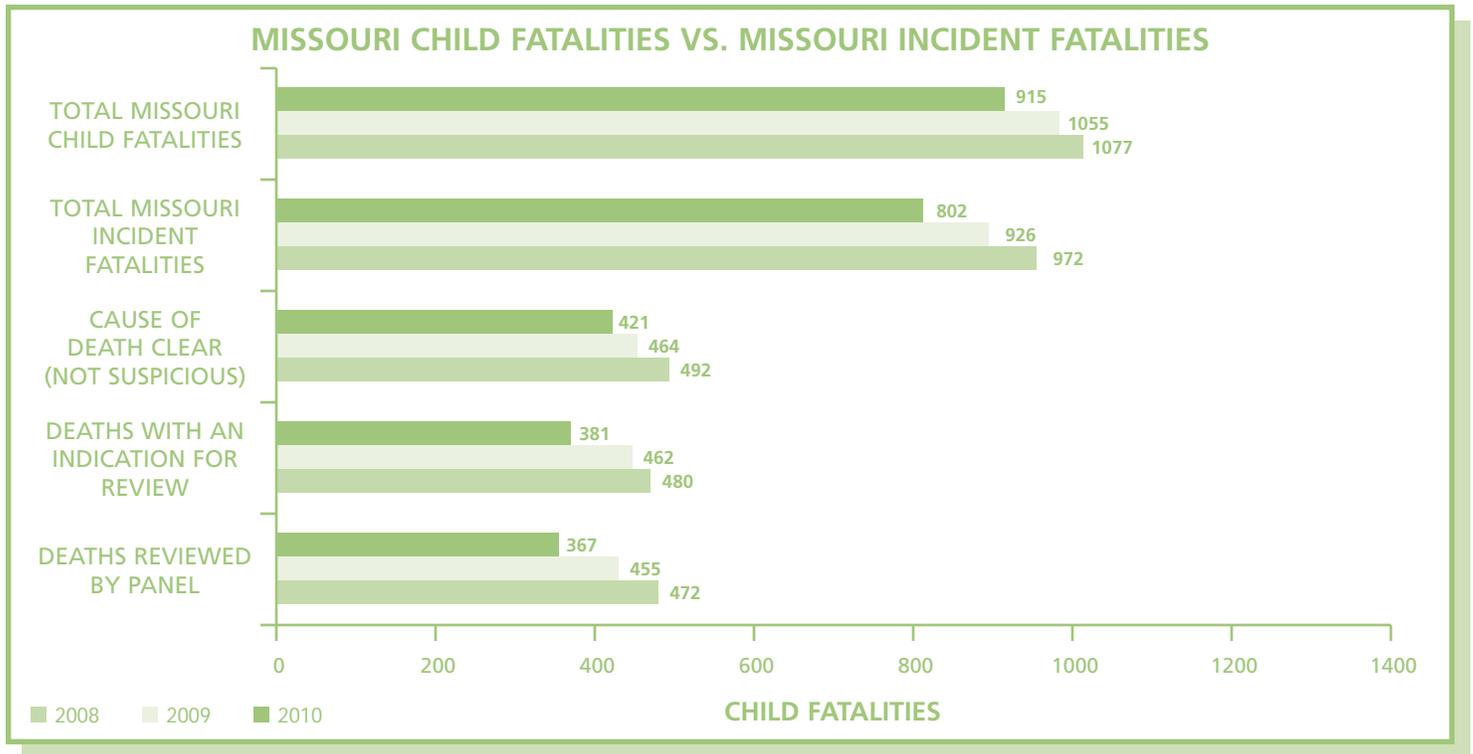

- Of **381** Missouri Incident Fatalities with indication for review as reported on Data Form 1 in 2010, **fourteen** did not receive required CFRP panel review, or panel findings were not submitted on Data Form 2. These **fourteen** fatalities are included in this 2010 CFRP Annual Report because the data, though incomplete, is useful and accurate within the limitations on the Data Form 1 information.
- **Sixty-eight** Missouri Incident Fatalities were not reported on either a Data Form 1 or Data Form 2, but were reported to the CFRP by death certificates from the Department of Health and Senior Service. From information provided by the death certificates, **five** of those **68** fatalities (9%) had at least one indicator for review, including **three** motor vehicle fatalities, **one** firearm and **one** drowning. Because we do not have sufficient information on these deaths, these fatalities are not included in the data for this annual report.
- While we are notified by the Department of Health and Senior Services of every child who receives a death certificate in the state, the data for this report comes from the Data Form 1's and Data Form 2's submitted by the county-based Child Fatality Review Panels. Compliance for Missouri Incidence deaths for Data Form 1's is 92% and Data Form 2's is 96%. Due to these program reporting compliance issues, our report does not reflect the actual total number of Missouri Child Fatalities and Missouri Incident Child Fatalities. Below is a chart showing the number of known child deaths, taken from all available sources, in Missouri from 2000 to 2010. Note the 20% reduction in overall deaths and the 21% reduction in Missouri-incident deaths since 2000.

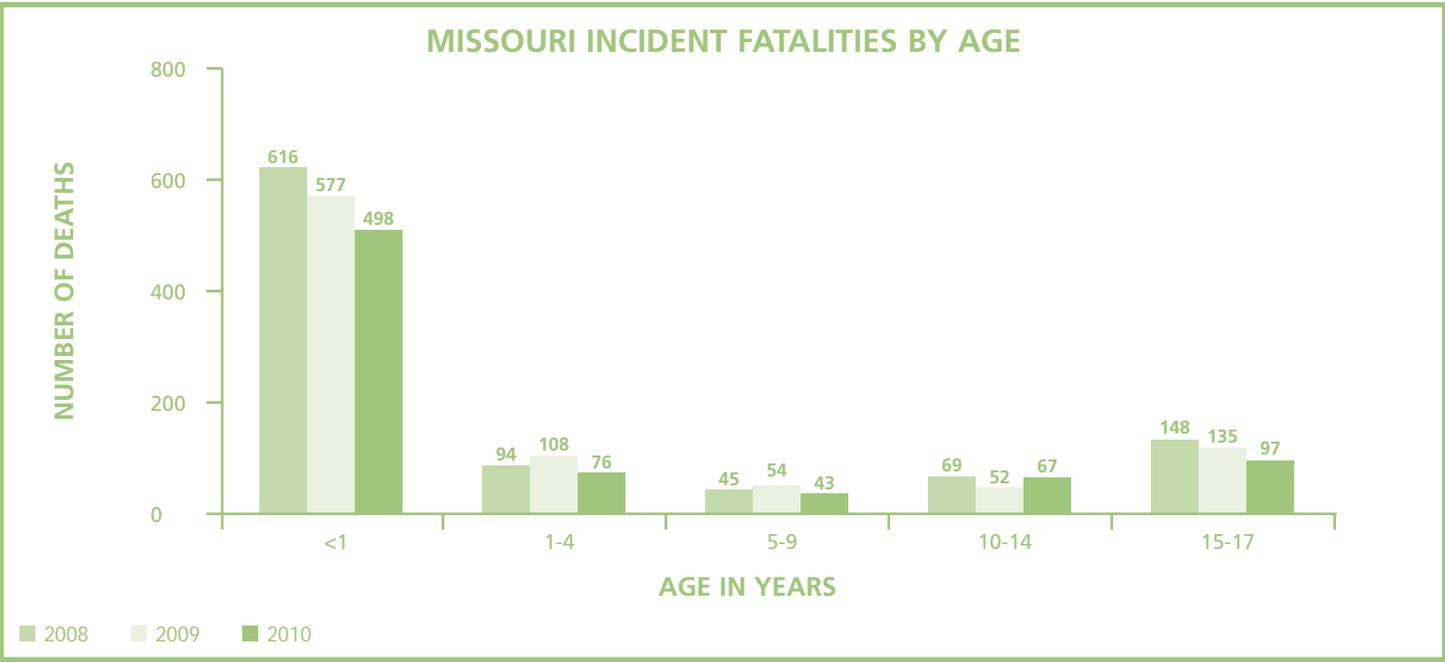

SUMMARY OF FINDINGS

Missouri Incident Fatalities

In 2010, STAT received information on **915** children age 17 and under who died in Missouri. Of those deaths, **802** were determined to be “Missouri Incident Fatalities” and therefore, subject to review by the coroner or medical examiner and county CFRP chairperson. Of the 802 deaths subject to review, **421** (53%) were not suspicious and did not require detailed review. The remaining **381** (47%) had indicators for review by a county CFRP panel, and of those **367** (96%) were reviewed and a Data Form 2 completed.

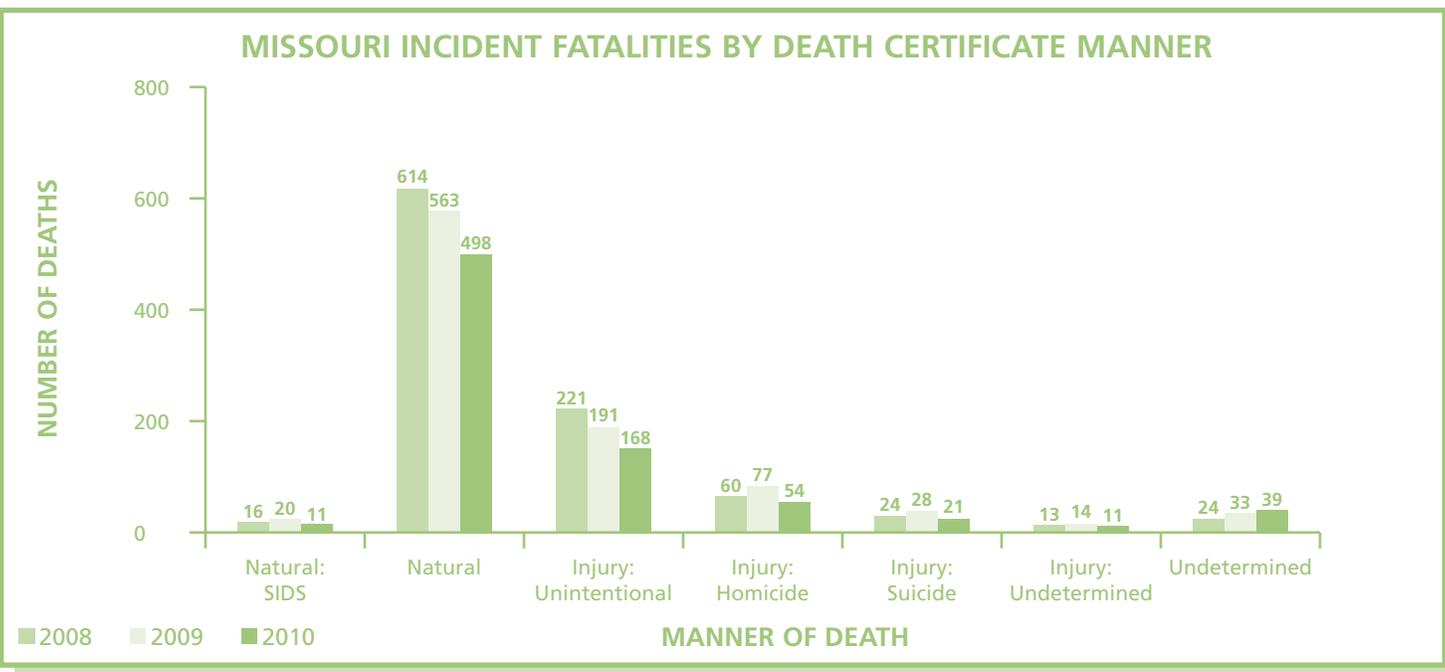

MISSOURI INCIDENT FATALITIES BY AGE

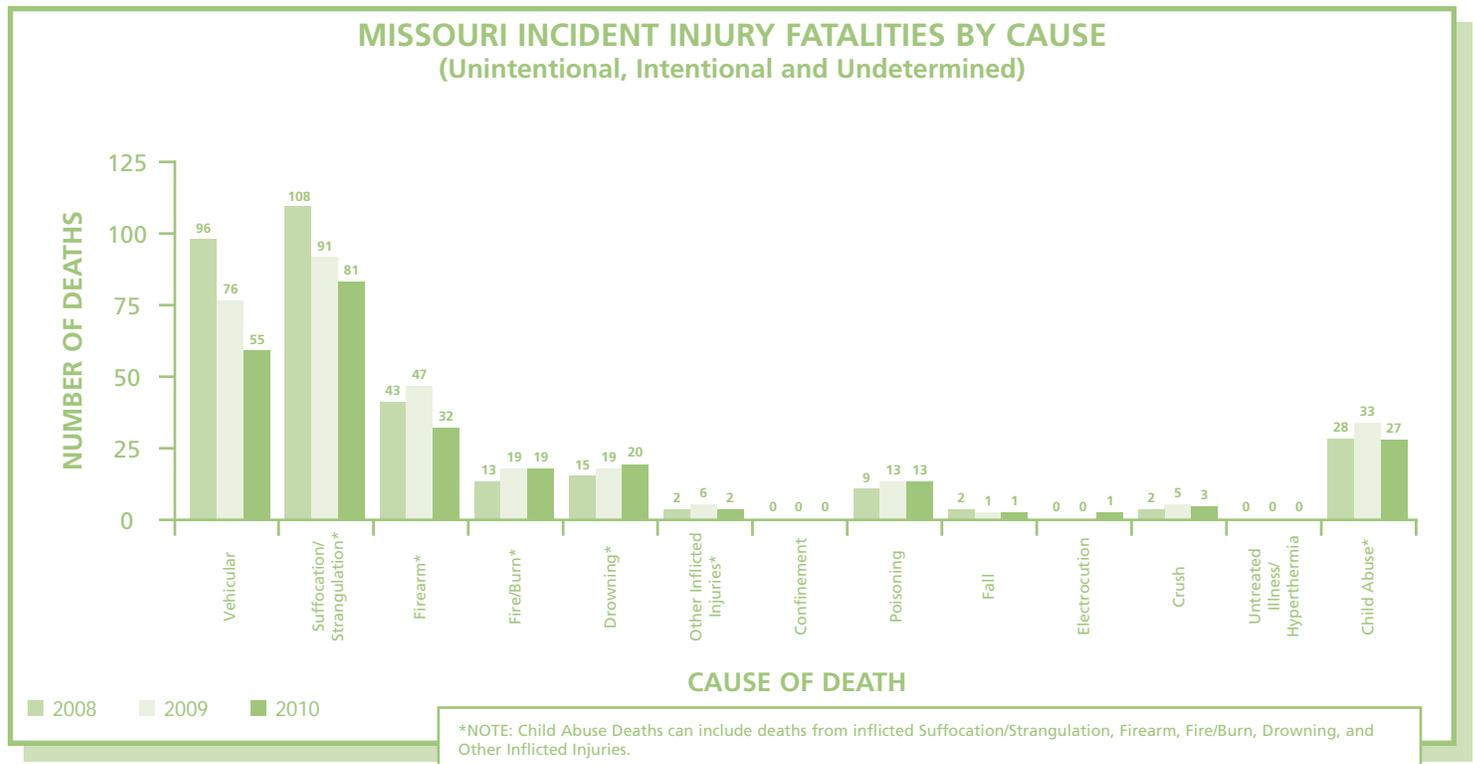

MISSOURI INCIDENT FATALITIES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010

MALE	567	542	485	BLACK	278	268	197
				OTHER	34	43	42
	972	926	802		972	926	802

MISSOURI INCIDENT FATALITIES BY DEATH CERTIFICATE MANNER

Manner and Cause of Death are different. *Manners of Death* on Missouri Death Certificates are defined as Natural, Accidental, Homicide, Suicide, Could Not Be Determined and Pending Investigation. For CFRP purposes, SIDS deaths are identified separately from other types of Natural deaths, as these deaths are of particular program interest; Accident, Suicide and Homicide are separated out into Injury: Intentional, Unintentional and Undetermined; Could Not Be Determined is changed to Undetermined; and Pending Investigation is excluded as what is gained from the review process will assist in determining the appropriate manner of death. The *Cause of Death*, on the other hand, is the actual mechanism by which the death occurred; i.e., firearm, vehicular, poisoning, suffocation, etc.

While Manner and Cause of Death are separate, it is the combination of the two that defines how the death occurred. For example, a child died from a firearm injury, but knowing if the injury was unintentional, intentional or undetermined will allow for a better understanding of how the child died. Most CFRP panel findings coincide with the Death Certificate Manner of Death, but there may be instances where they do not coincide. This can occur when other factors gleaned from the review process were not readily available at the time the death certificate was completed; i.e., the death certificate may indicate SIDS as the cause of death, but from panel concerns related to unsafe bedding and/or bedsharing, they might complete the data collection forms as the death being from Suffocation/Strangulation or even Undetermined. Panel findings may also result in getting the official manner of death amended.

Just as SIDS deaths are separated from natural cause, intentional injury deaths that are determined to be child abuse are also separated out from other intentional injury deaths. For example, if a child receives an intentional inflicted burn from a person who has care, custody and/or control of the child, the death would only be addressed in the Child Abuse section. In deaths where the panel felt that serious neglect may have contributed to, but did not cause the death, it will be only noted as Fatal Child Neglect in this section, but the death will still be counted in the appropriate manner and causal categories.

NATURAL FATALITIES (OTHER THAN SIDS)

“In the United States -- as in other industrialized countries--the infant mortality rate has declined dramatically during this century. Yet, despite the high quality and widespread availability of neonatal intensive care technology in this country, the infant mortality rate remains higher than that of many developed nations.”

Congressional Budget Office - *Factors Contributing to the Infant Mortality Ranking of the United States*

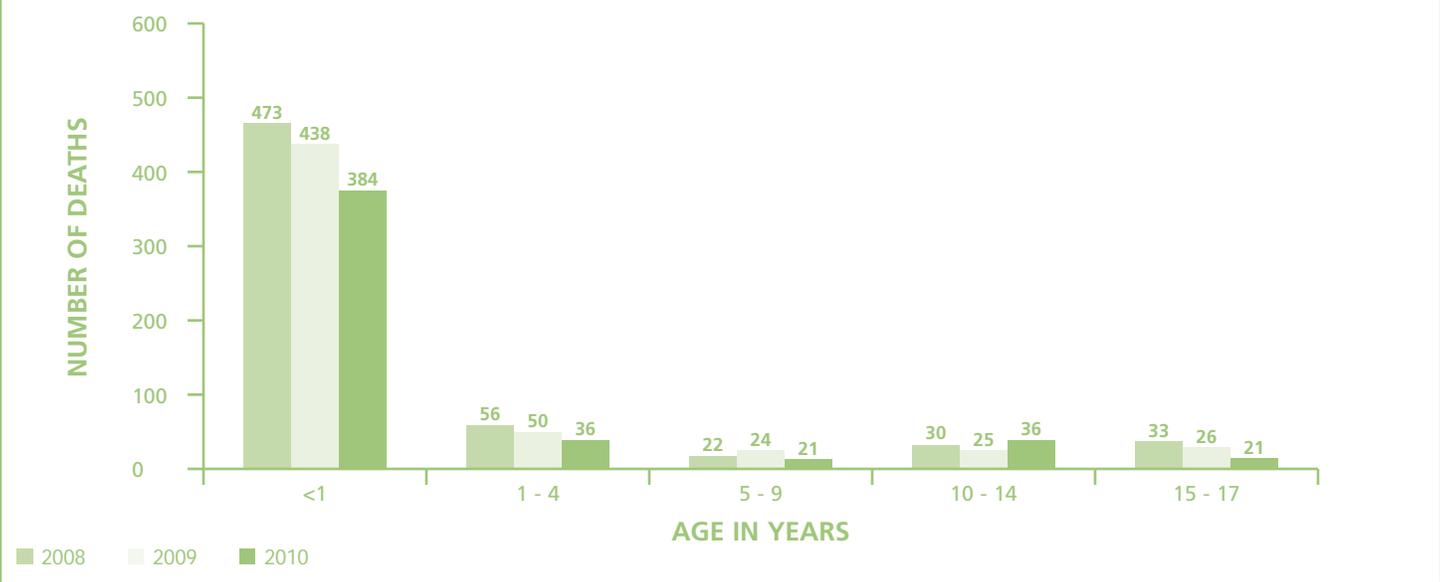

Natural fatalities, other than SIDS, were responsible for the deaths of 498 Missouri children in 2010, representing 62% of all Missouri incident fatalities.

Most child deaths are from natural causes. Natural deaths include illnesses, prematurity, congenital anomalies, cardiac conditions, cancer, infection and other conditions. The vast majorities of natural deaths occur before the first year of life and are often related to prematurity or birth defects. Although SIDS is considered a natural death of undetermined cause, Natural - SIDS deaths will be specifically addressed in a separate section.

NATURAL FATALITIES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	273	257	208	WHITE	412	367	334
MALE	341	306	290	BLACK	180	163	142
				OTHER	22	33	22
	614	563	498		614	563	498

ILLNESS/NATURAL CAUSE DEATHS BY AGE

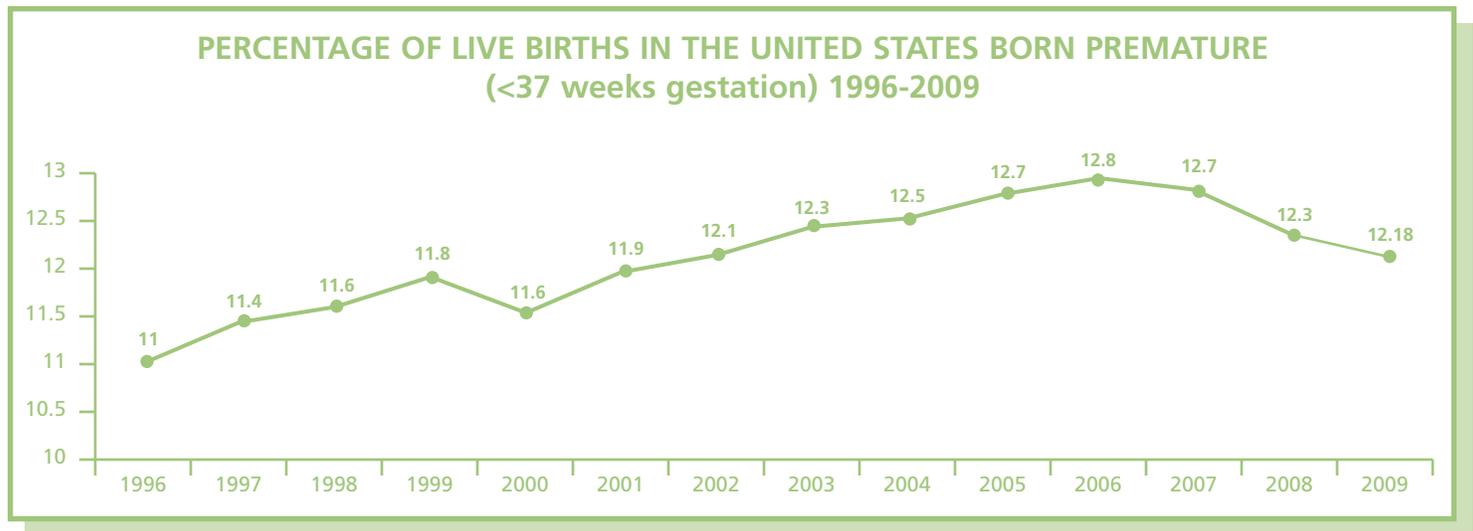

According to the Missouri Department of Health and Senior Services, prematurity was the death certificate cause of 227 deaths in Missouri in 2010, representing 46% of all natural cause deaths, other than SIDS. Of those 227, 147 (65%) were born at 25 weeks or less gestation, with 38 (17%) being born at less than 20 weeks gestation. The second leading death certificate cause of illness/natural deaths was congenital anomalies which caused 128 (26%) deaths of Missouri children in 2010. The death certificate causes of the remaining illness/natural deaths are broken down into categories such as cancer, heart disease, metabolic disorders and other medical conditions.

Infant Mortality

Infant mortality is one of the most important indicators of the health of a nation and the United States is lagging behind much of the developed world. According to the Centers for Disease Control and Prevention (CDC), the U.S. ranks 30th in the world in infant mortality behind most European countries, Canada, Australia, New Zealand, Hong Kong, Singapore, Japan, and Israel.

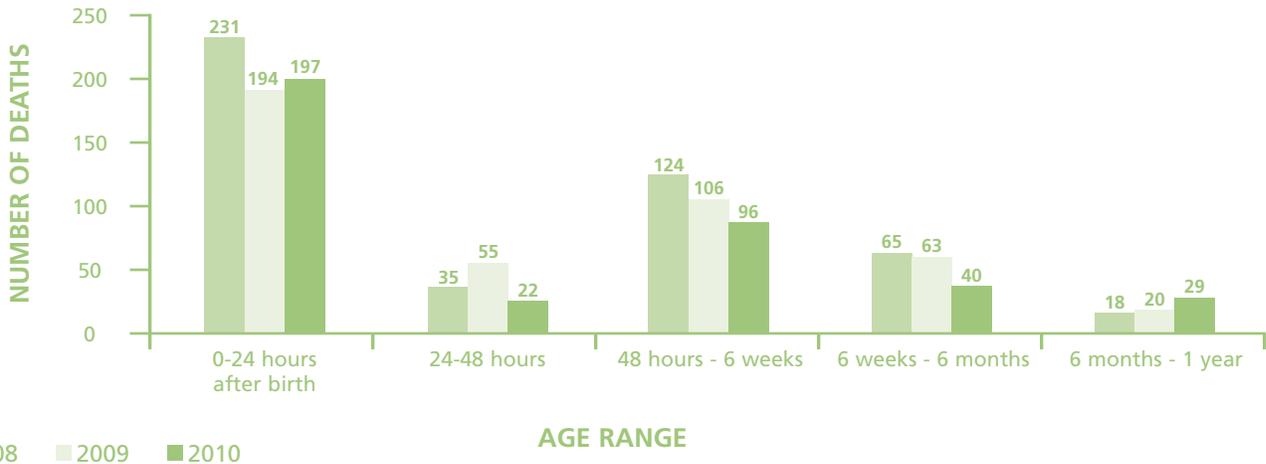

Data suggests that the main reason for the United State’s high infant mortality rate is the significant rate of preterm births in this country. The good news is that this rate has begun to drop over the last few years. In 2006, 12.8% of all live births were born at less than 37 weeks gestation; by 2008, that rate had dropped to 12.3%. The preterm birth rate declined in 2009 for the third straight year to 12.18 percent of all births. In Missouri, in 2010 the infant mortality rate dropped from 7.2 to 6.5 per 1000 live births.

The March of Dimes states that, “Preterm birth is the leading cause of death in the first month of life in the United States.” Those children who do survive being born prematurely could potentially face lifelong serious health issues.

Infants less than one year of age comprised the majority of the natural cause deaths in 2010, with 384 (77%). Of the 219 (58%) deaths that occurred within the first 48 hours, 197 (90%) occurred within 24 hours after birth.

CHILDREN LESS THAN ONE YEAR WHO DIED OF ILLNESS/NATURAL CAUSES BY AGE AT DEATH

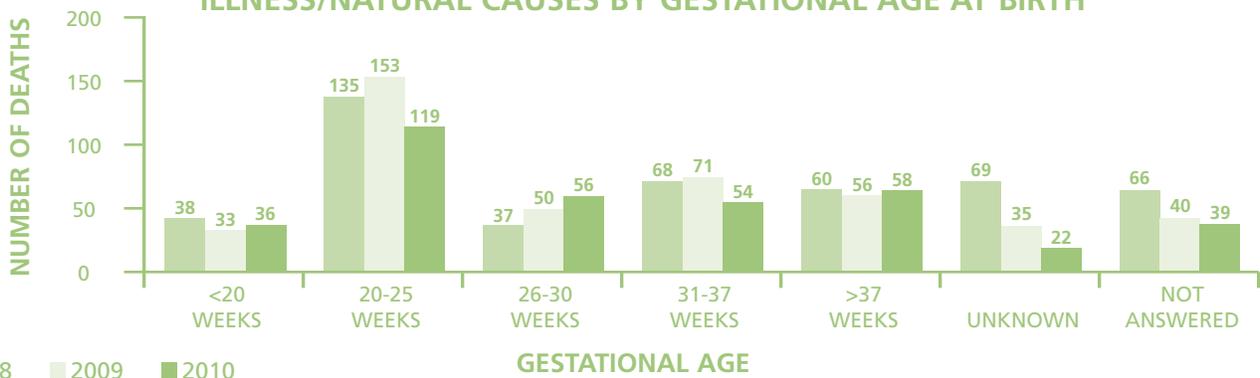

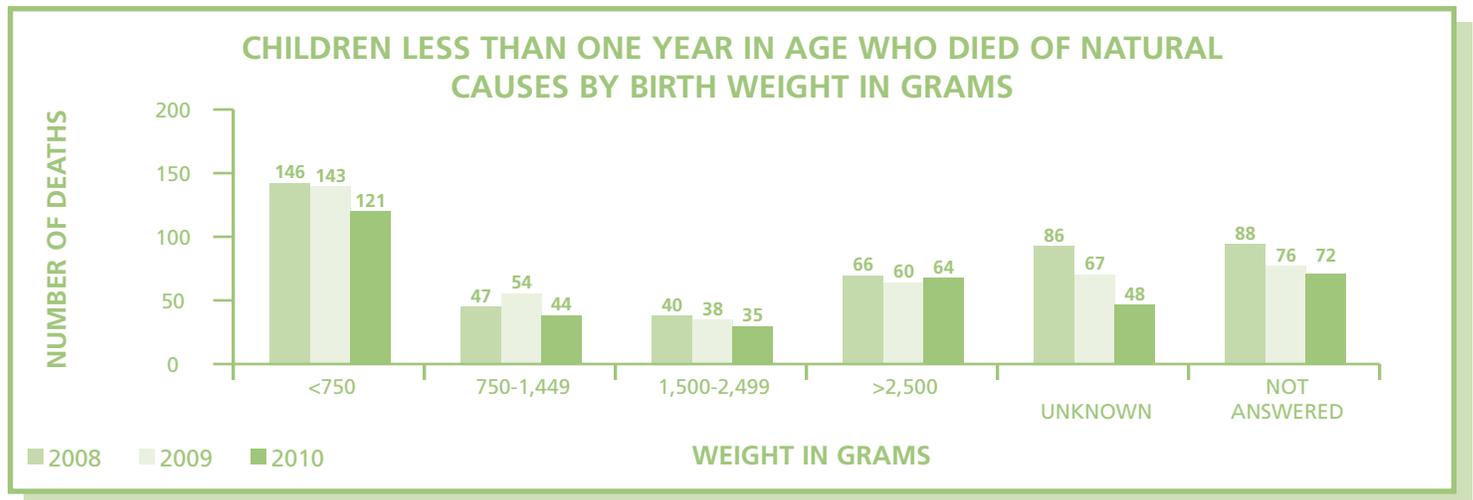

CHILDREN LESS THAN ONE YEAR WHO DIED OF NATURAL CAUSES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	211	192	155	WHITE	311	283	251
MALE	262	246	229	BLACK	143	127	114
				OTHER	19	28	19
	473	438	384		473	438	384

Infants can be classified as premature for two different reasons. According to the CDC, they first can be born “preterm” because of a “curtailed gestation (gestational age of <37 completed weeks)” or they can be “premature by virtue of birth weight (2,500 grams or less at birth)”. Children in the second category are referred to as “Low Birth Weight” or LBW children. This differentiation is made because while the two can be linked, there are other factors besides prematurity which can result in a low birth weight pregnancy. In Missouri, in 2010, 265 infants were reported to be born preterm on the CFRP Data Forms 1 and 2, while 200 low weight births were reported during that same period.

CHILDREN LESS THAN ONE YEAR OF AGE WHO DIED OF ILLNESS/NATURAL CAUSES BY GESTATIONAL AGE AT BIRTH

Maternal health issues and the use of drugs, alcohol or tobacco during pregnancy are other factors of low birth weight. The following data was collected from natural deaths where the county panels completed a Data Form 2.

Fetal and Infant Mortality Review (FIMR) in Missouri

According to the American Congress of Obstetricians and Gynecologists, the death of a child, especially the youngest, most vulnerable infant, is viewed as a sentinel event that is a measure of a community's overall social and economic well being as well as its health. Since the 1990's, two forms of infant death review have been established, both having similarities, but slightly different approaches, Fetal and Infant Mortality Review (FIMR) and Child Death Review (CDR).

Fetal mortality: The death of an in utero fetus of 20 weeks or more gestation. Although such a death can result from developmental issues, the mother's health and inadequate prenatal care can also have an adverse effect.

Infant mortality: The death of child under one year of age, which can be from a variety of natural and unnatural causes.

Similar to CFRP, FIMR is a local area/community process, which has case review teams comprised of membership from professional health, welfare, education and advocacy organizations, as well as public and private agencies. The first stage of the process is for the review team to collect information from various available sources including, but limited to, medical, public health and community services records, WIC, family and mother interviews. The evaluation from these sources can help develop a better understanding of how the death occurred, what services and resources can be provided and how to potentially prevent future deaths. Upon completion, the team prepares a summary with de-identified information to protect the confidentiality of those associated the death and subsequent review.

The second stage of the process involves another team comprised of individuals who have the fiscal resources, political and/or community influence to make policy and systemic changes, as well as implement broad-based prevention strategies and best practices.

The FIMR process in Missouri conforms to the principals and guidelines set by The National Fetal and Infant Mortality Review Program, which “is a collaborative effort between the American College of Obstetricians and Gynecologists and the Maternal and Child Health Bureau, Health Resources and Services Administration.” The overall goal of Missouri’s FIMR is “to enhance the health and well being of women, infants and families by improving the community resources and service delivery systems available to them.

The FIMR program in Missouri was established in 2003, when the Department of Health and Senior Services collaborated with the Infant Mortality Workgroup of the Maternal Child and Family Health Coalition of Metropolitan St. Louis and Bootheel Healthy Start. The Bootheel program disbanded after a few months; however, the St Louis FIMR, which began with just three zip codes served by the Healthy Start program, has expanded to all of St. Louis City and County. Since its inception, they have abstracted and reviewed over 70 infant and fetal deaths.

In 2004, the Maternal Child Health Coalition of Greater Kansas City began a Fetal and Infant Mortality Review program in the seven zip codes served by Healthy Start in Kansas City. Since its inception, the Greater Kansas City FIMR has abstracted and reviewed more than 130 infant and fetal deaths.

The presence of FIMR programs serving the major metropolitan areas in Missouri will bring about a more thorough understanding of the contributing factors of fetal and infant deaths, as well as a larger engagement of community health professionals and institutions to improve maternal and child health throughout our state.

While there are many similarities between CFRP and FIMR, including basic human concern and advocacy, there are distinct and important differences, such as the purpose and timing of the reviews. In Missouri, FIMR and CFRP will be distinct, but complementary systems, sharing a common mission and some promising opportunities for collaboration. It is anticipated that when appropriate, the two systems will be able to collaborate in significant ways, such as joint reporting of aggregated findings, sharing recommendations with media and the public, and improving systems and resources for children, their mothers and families.

For additional information, refer to:

Missouri Department of Health and Senior Services, Fetal-Infant Mortality Review (FIMR)

National Fetal and Infant Mortality Review Program

<http://www.nfimr.org/>

SUDDEN UNEXPECTED INFANT DEATHS

In 2010, there were 118 sudden, unexpected deaths of infants less than one year of age in Missouri.

Representative Cases:

- **Infants should be held while feeding.**

A three-month-old infant was placed in a pack 'n play along with a propped bottle by the step-father. The child was later found on his back, pale with vomit and the bottle nipple in his mouth.

- **Infants should be placed on their backs for sleep.**

A three-month-old infant was last known alive when he was rocked to sleep and put down in a crib, face down with a blanket placed over his back. Mother found the child in the morning, limp and cool to the touch.

A two-month-old child was wrapped in a blanket placed in a crib on her left side by the grandmother. She was found in the morning; face down, unresponsive and without a pulse.

- **The safest place for infants to sleep is in a standard crib with firm mattress and no soft bedding.**

A four-month-old child was placed on a pillow in a bassinet in the early morning. She was later found on her stomach, face down into the pillow, not breathing.

A seven-month-old child was placed on his back in a pack 'n play with three or four blankets folded under him for padding. He was found in the morning blue, tangled in the blankets, with one of them wrapped tightly around his head and chest. EMS was able to revive him, but he was brain dead.

- **Infants should not sleep with other children or adults.**

Parents and a one-year-old brother were sleeping with two-month-old infant in an adult bed with the infant placed in the middle. In the morning, the father found the brother on top of the infant and the infant unresponsive.

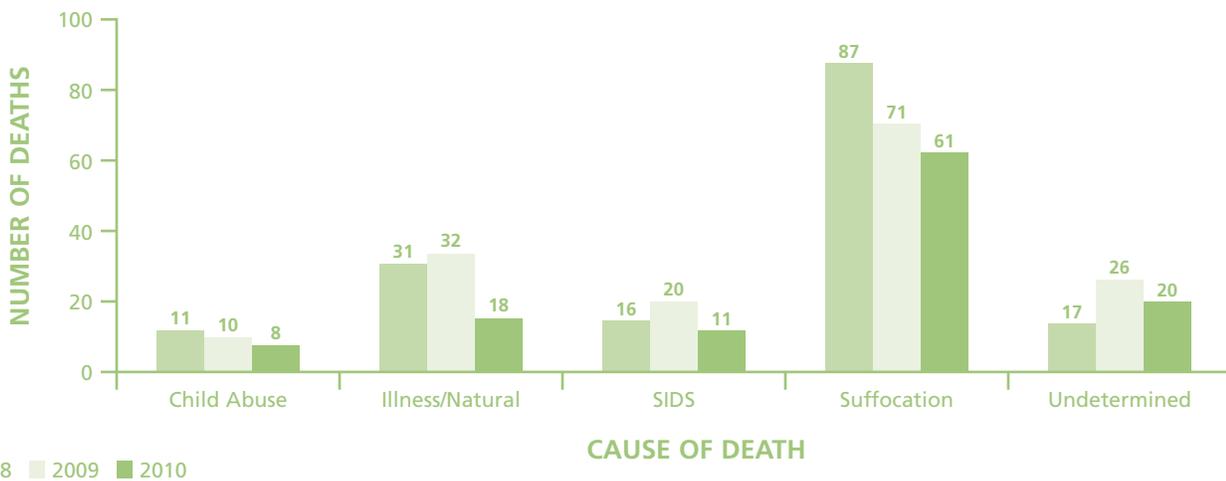

The grandparents were watching the infant. When the parents returned, the father fed the infant while sitting on the sofa, placed her on his shoulder to burp her and fell asleep. When he awoke, he found infant wedged between his body and the couch.

In 2010, there were 118 sudden unexpected deaths of infants under the age of one year reported to the Child Fatality Review Program. Based on autopsy, investigation, social/medical and CFRP panel review, 11 were diagnosed as Sudden Infant Death Syndrome, 18 Natural Causes, 61 Suffocation, 20 Undetermined, and 8 infants were found to be victims of Child Abuse. Those eight deaths are discussed under the "Fatal Child Abuse and Neglect" section of this report.

SUDDEN, UNEXPECTED INFANT DEATHS BY CAUSE

Investigation of Sudden Unexpected Infant Deaths

According to the CDC, each year in the United States, more than 4,500 infants die suddenly of no obvious cause. Half of these Sudden Unexpected Infant Deaths (SUID) are due to Sudden Infant Death Syndrome (SIDS). SIDS rates declined starting in the 1990’s in large part with the implementation of the National Back to Sleep Campaign, which encouraged placing the infant to sleep in non-prone positions. The endorsement of safe sleep practices by the American Academy of Pediatrics (AAP), which was reaffirmed in 2009, has also made a positive impact over the past decade. However, studies have shown that since 1999, some deaths previously classified as SIDS are now classified as accidental suffocation or undetermined. These findings suggest that changes in reporting of cause of death may account for part of the recent decrease in SIDS rates and that, in fact, the rate of sudden unexpected infant deaths in the United States has not changed significantly during this time period.

By definition, SIDS is the “sudden death of an infant under one year of age which remains unexplained after a thorough case investigation, including performance of a complete autopsy, examination of the death scene, and review of the clinical history.” (Willinger et al, 1991) Yet over time, it became apparent that sudden unexpected infant deaths were often not being adequately investigated, and information on cause of death was neither consistently collected, nor accurately reported. To address these concerns, the CDC worked with other federal agencies and

organizations representing medical examiners, coroners, death scene investigators, emergency medical personnel, law enforcement officials, forensic nurses, SIDS researchers, infant death review experts and parents who have experienced a death of an infant, to create a set of universal definitions and guidelines for the investigation of sudden unexpected infant deaths. As a result of these efforts, in 2006, the CDC introduced the Sudden Unexpected Infant Death Investigation (SUIDI) Reporting Form for state and local use in infant death scene investigations, along with a comprehensive training curriculum and other related materials. The training highlights infant growth and development, interviewing and investigative skills, scene re-creation using a doll, and how to fill out a death certificate. The SUIDI Report Form and other additional investigative resource information can be found at www.cdc.gov/sids/suid.htm.

Of the 118 sudden unexpected infant deaths in Missouri in 2010, a scene investigation was completed in 110 cases (94%); 66 (60%) of those were completed by a medical examiner/coroner or their investigator. The State Technical Assistance Team *Death Scene Investigative Checklist for Child Fatalities* is available to professionals involved in the investigation and evaluation of all child deaths. The Checklist provides a guide to the investigator, regardless of experience level, to consistently collect the information necessary for an accurate determination of the cause and manner of death. The investigative checklist is available at www.dss.mo.gov/stat or by calling 1-800-487-1626.

Sudden Unexpected Infant Deaths in Child Care Settings

Two thirds of U.S. infants younger than one year are in non-parental child care, with thirty-two percent in full-time child care. (Ehrle J, Adams G, Tout K; 2001) Approximately 20% of SIDS deaths occur while the infant is in the care of a non-parental caregiver. (Moon, Patel and Shaefer, 2000) According to the American Academy of Pediatrics, less than 9% of SIDS deaths should occur in child care. One of the possible reasons for this discrepancy is that non-prone positioning and other risk reduction measures are not universally being practiced among child care providers. (Moon and Biliter, 2000) In Missouri, 10 sudden unexpected infant deaths occurred in child care settings in 2010. Of those, four were diagnosed as unintentional suffocation, one was found to have an undiagnosed illness, two were SIDS and two were undetermined. Missouri Daycare Administrative rules now require that a child under twelve-months old be placed on it's back to sleep, and an infant's head remain uncovered during sleep.

Sudden Infant Death Syndrome (SIDS)

In 2010, Sudden Infant Death Syndrome (SIDS) was the cause of death of 11 Missouri Infants

The term Sudden Infant Death Syndrome (SIDS) was proposed in 1969, to describe a clinical entity with characteristic findings to diagnose the sudden unexpected deaths of infants, typically during their sleep. SIDS is the sudden death of an infant under one year of age, which remains unexplained after a thorough case investigation, including performance of a complete autopsy, examination of the death scene, and review of the clinical history. At this time, SIDS is still a diagnosis of exclusion; even though current research may be finding the mechanisms of SIDS. There are still no agreed upon pathological markers that distinguish SIDS from other causes of sudden unexpected infant death. There are no warning signs or symptoms. Ninety percent of SIDS deaths occur in the first six months of life, with a peak at two to four months. While there are several known risk factors, the specific cause or causes of SIDS are not yet defined.

Current Research Findings and Theories

The National Institutes of Health states that scientists have found that the brains of infants who die of sudden infant death syndrome (SIDS) produce low levels of serotonin, a brain chemical that plays a vital role in regulating breathing, heart rate, and sleep. This goes along with earlier findings that the brains of infants who died of SIDS had higher concentrations of cells that used serotonin in the medulla oblongata, a region of the brain stem. Studies show that while a child who dies of SIDS may look normal, many of them may have an underlying genetic abnormality which made them more susceptible and it is hoped that these findings will eventually lead to a blood test that can determine which children are at greatest risk.

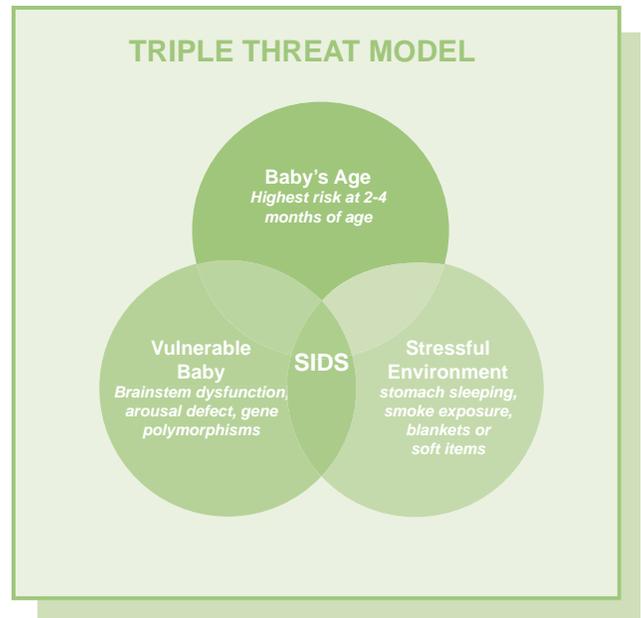

Greater risk does not necessarily mean that a child with this abnormality will die from SIDS. Brain abnormalities are only one of three components of what *First Candle* calls the “Triple Risk Model”. The model describes the confluence of events that may lead to the sudden death of an infant. This model involves a vulnerable infant (one with an underlying genetic abnormality, as stated above). The next component is the infant’s age and developmental factors. The rapid growth of an infant with the brain abnormalities, especially during the first six months, causes their system to become unstable.

This instability is thought to make an infant less able to deal with the final component - environmental challenges. It is the interaction of these three components, when the risk for sudden infant death is at its greatest.

Continued research and thorough investigations will allow for better identification of the intricate causes behind sudden infant death. Subsequently, identified risk reduction efforts and implementation of best prevention practices, based upon what has been learned, will have an even greater impact in saving infant lives.

Information about safe sleep is available to parents from health care professionals, social service agencies and even public service announcements, but there are many outside factors which can influence the behaviors of parents. The advice of friends, their own parents and incorrectly formed habits from previous child-rearing experiences can all have an impact on sleep practices, and now it turns out that the media may also have a negative effect in following safe sleep guidelines. A 2009 study published in *Pediatrics* concluded that “More than one third of pictures of sleeping infants in magazines geared toward childbearing women demonstrated infants in an inappropriate sleep position, and two thirds of pictures of infant sleep environments were not consistent with AAP recommendations. Messages in the media that are inconsistent with health care messages create confusion and misinformation about infant sleep safety and may lead inadvertently to unsafe practices.”

With this in mind we may need to step up the efforts to encourage parents to maintain safe sleep practices for infants as well as work toward removing such dangerous media representations from future publications both at a local, and national level through regulations or guidelines.

Other Risk Factors

Other risk factors, many associated with the mother’s health and behavior, place the infant at a significantly higher risk of sudden, unexpected infant death.

- Prematurity
- Low birth weight
- Less than 18 months between births
- Mother younger than 18
- Prenatal smoking
- Multiple birth
- Late or no prenatal care
- Alcohol and substance abuse

Certain environmental stressors have been shown to be highly significant risk factors. Environmental stressors are modifiable and the reduction of these risk factors through parent/caretaker education has great potential to save infant lives.

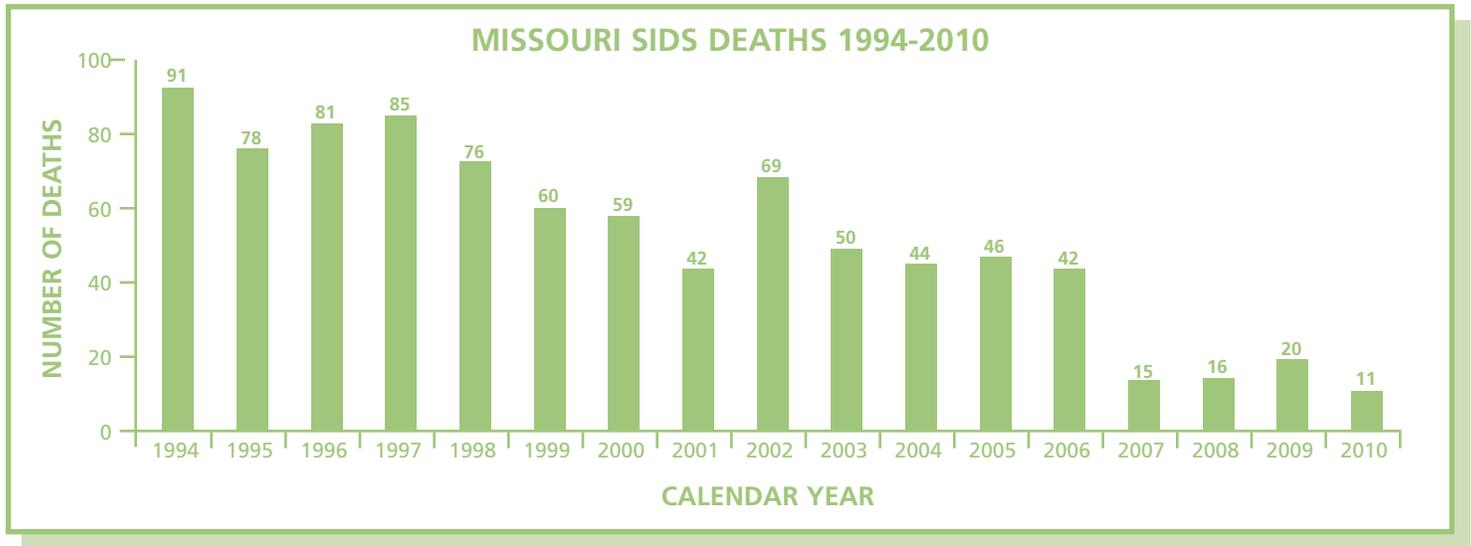

- Prone or side sleeping
- Soft sleep surfaces
- Loose bedding
- Bedsharing
- Overheating
- Exposure to tobacco smoke

SIDS FATALITIES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	5	7	3	WHITE	12	17	10
MALE	11	13	8	BLACK	4	2	1
				OTHER	0	1	0
	16	20	11		16	20	11

SIDS BY AGE (IN MONTHS)

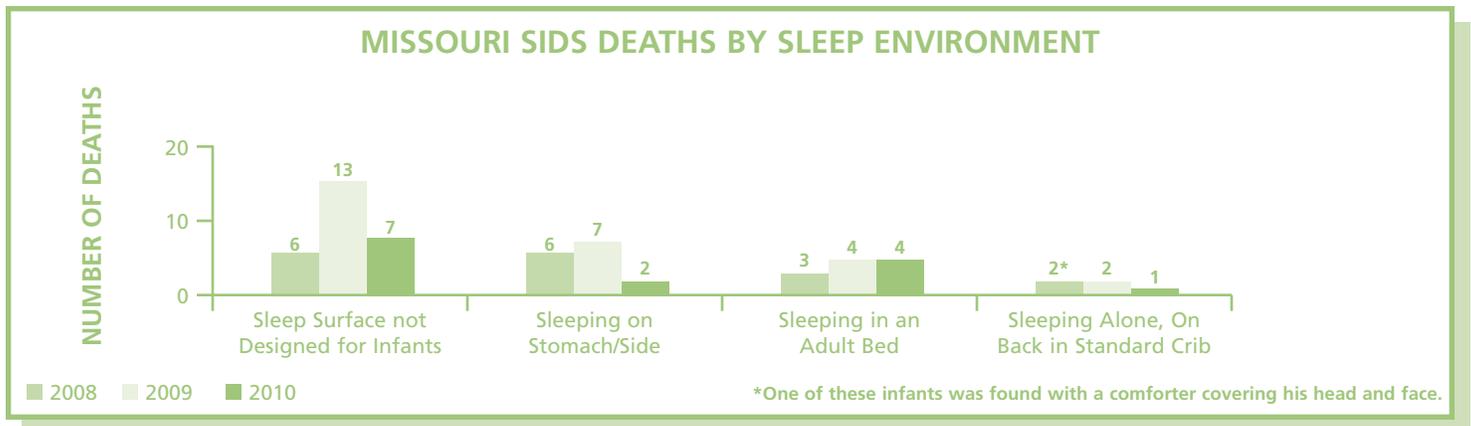

Nationally, of those infants whose deaths are attributed to Sudden Infant Death Syndrome (SIDS) each year, many are found in potential suffocation environments, frequently on their stomachs, with their noses and mouths covered by soft bedding.

Unsafe sleep arrangements occur in the large majority of cases of sudden infant death diagnosed as SIDS, unintentional suffocation, and cause undetermined. Unsafe sleep arrangements include any sleep surface not designed for infants, inappropriate bedding, sleeping with head or face covered, and sharing a sleep surface.

In Missouri in 2010, of the **11** sudden unexpected infant deaths reviewed by county CFRP panels and diagnosed as SIDS, **two** (18%) were known to be sleeping on their stomach or side, though five other children were listed as “unknown sleeping position,” possibly due to the reluctance of caregivers to admit they may have placed the child in a compromising sleep position. **Seven** of the eleven were not sleeping in a standard crib on a firm mattress, of which **four** were known to be sleeping in an adult bed. Only **one** infant who died suddenly and unexpectedly, whose deaths were diagnosed as SIDS, was known to be sleeping alone on its back, in a standard crib. This graph demonstrates that the safest place for an infant to sleep is in a standard crib, on his or her back, without soft bedding or toys of any kind.

UNINTENTIONAL SUFFOCATION IN INFANTS

Unintentional Suffocation was the cause of death of 61 Missouri infants in 2010.

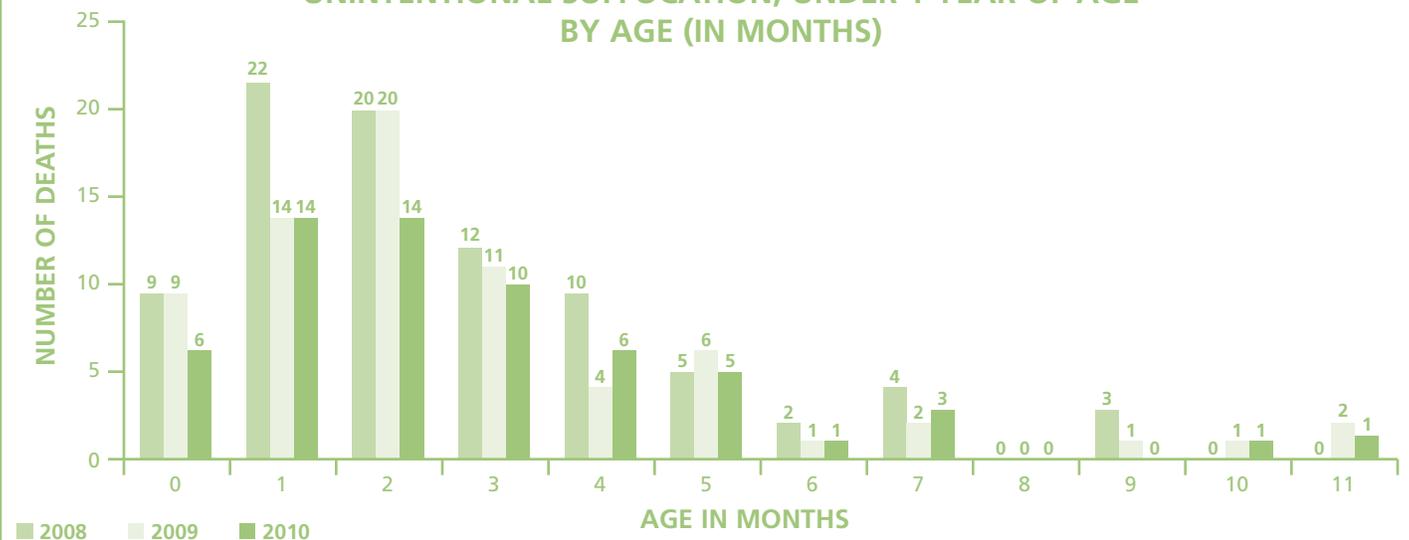

Most infant deaths due to **suffocation** are directly related to an unsafe sleep environment. Many parents and caregivers do not understand the risks associated with unsafe sleeping arrangements. Infants can suffocate when being placed in compromising positions such as buried in a soft mattress, cushion, pillow, comforter or bumper pad, or when their faces, noses and mouths are covered by soft bedding, such as pillows, quilts, comforters and sheepskins. Of the **61** Missouri infants deaths diagnosed as unintentional suffocation in 2010, **33** were sharing a sleep surface with one or more individuals. Of those, **25** were sleeping in an adult bed. CFRP panels reported indications of improper use of bedding involved in **17** infant deaths.

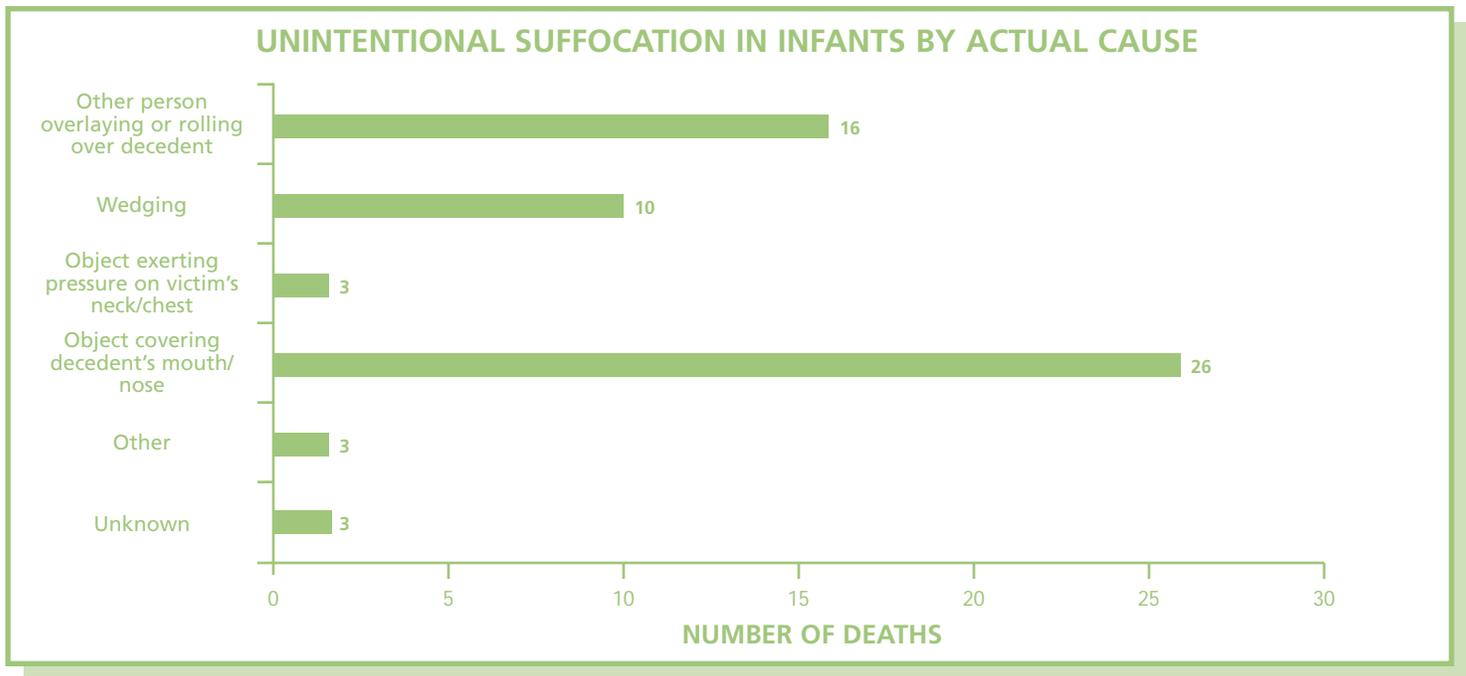

An **overlay** is a type of unintentional suffocation that occurs when an infant is sharing the same sleep surface with one or more persons (adults, other children or even pets) and someone rolls over on them. Suffocation due to overlay can be verified by one of the following means: (1) the admission of someone who was on the same sleep surface, that they were overlying the infant when they awoke; or (2) the observations of another person. Infant deaths involving possible or suspected overlay are classified as **undetermined cause**, because the actual position of the infant and other person at the time of death were not witnessed.

UNINTENTIONAL SUFFOCATION BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	37	27	25	WHITE	50	43	43
MALE	50	44	36	BLACK	34	23	11
				OTHER	3	5	7
	87	71	61		87	71	61

UNINTENTIONAL SUFFOCATION, UNDER 1 YEAR OF AGE BY AGE (IN MONTHS)

Undetermined in Infants

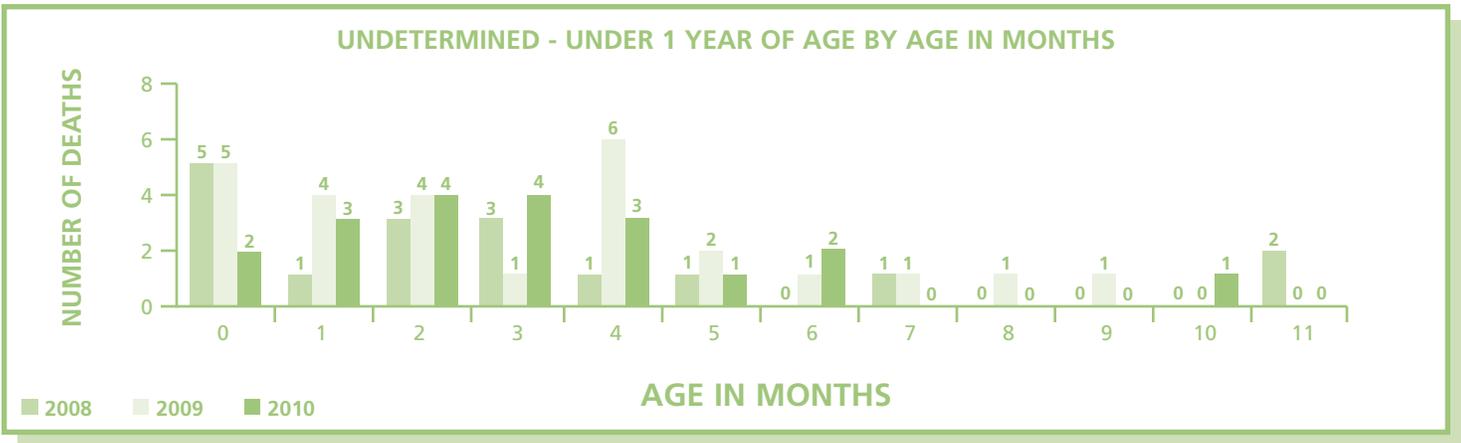

In 2010, the cause of death of 20 Missouri Infants could not be determined.

In some cases, even the most thorough autopsy and scene investigation do not produce a definitive cause of death, yet the risk factors are present that are significant enough to have possibly contributed to the death. Such risk factors include unsafe or challenged sleep environment, possible medical neglect and the possibility of undiscovered inflicted injury.

Recent studies of epidemiological factors associated with sudden unexpected infant deaths, demonstrate that prone sleeping and the presence of soft bedding near the infant's head and face pose very strong environmental challenges, by limiting dispersal of heat or exhaled air in the vast majority of cases. The extent to which such environmental challenges play a role in a particular sudden infant death often cannot be determined. Therefore, a sudden unexpected infant death involving an unsafe sleep environment may be classified as undetermined, when unintentional suffocation is not conclusively demonstrated by the scene investigation.

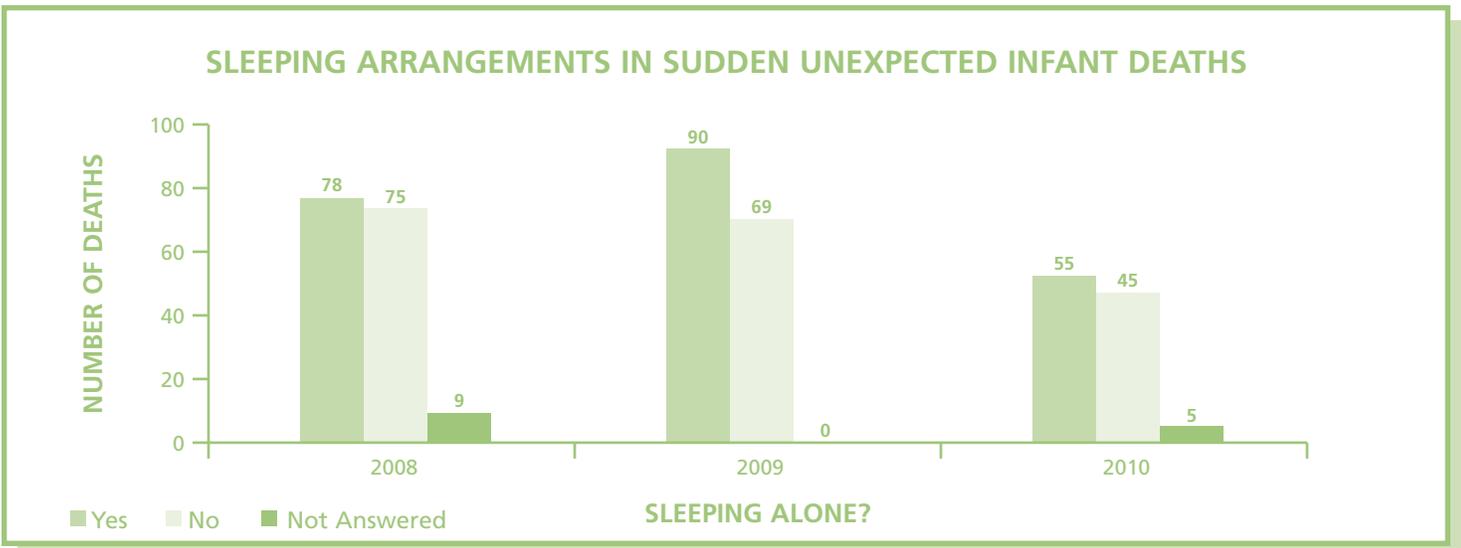

UNDETERMINED IN INFANTS BY SEX AND RACE

Safe Sleep Environments for Infants

Many sudden unexpected infant deaths occur in sleeping environments. In 2010 there were 105 sudden unexpected infant deaths in which sleeping arrangements were a factor, 55 (52%) of these children were sleeping alone, 45 (43%) were sleeping on the same surface as one or more others and 5 were unanswered.

Risk Reduction Recommendations:

The new American Academy of Pediatrics guidelines on reducing the risk of SIDS and other sleep-related deaths were announced in October 2011. The following is a summary of their latest recommendations:

Level A Recommendations:

- Always place your baby on his or her back for every sleep time.
- Always use a firm sleep surface. Car seats and other sitting devices are not recommended for routine sleep.
- The baby should sleep in the same room as the parents, but not in the same bed.
- Keep soft objects or loose bedding out of the crib. This includes pillows, blankets and bumper pads.
- Pregnant women should receive regular prenatal care.
- Avoid tobacco, alcohol and illicit drug use during pregnancy and after birth.
- Breastfeeding is recommended.
- Consider offering a pacifier at nap time and bedtime.
- Avoid overheating.
- Do not use home cardio-respiratory monitors as a strategy for reducing the risk of SIDS.
- Expand the national campaign to reduce the risk of SIDS to include a major focus on the safe sleep environment and ways to reduce the risks of all sleep-related infant deaths, including SIDS, suffocation and other accidental deaths; pediatricians, family physicians, and other primary care providers should actively participate in this campaign.

Level B Recommendations:

- Infants should be immunized in accordance with recommendations of the AAP and the Centers for Disease Control and Prevention.
- Avoid commercial devices marketed to reduce SIDS.
- Supervised, awake tummy time is recommended to facilitate development and to minimize development of a misshapen head.

Level C Recommendations:

- Health care professionals, staff in newborn nurseries and NICUs, and child care providers should endorse the SIDS risk-reduction recommendations from birth
- Media and manufacturers should follow safe-sleep guidelines in their messaging and advertising.
- Continue research and surveillance on the risk factors, causes, and physical mechanisms of SIDS and other sleep-related infant deaths, with the ultimate goal of eliminating these deaths entirely.

Prevention Recommendations

For parents and parents to be:

- *Maternal and Infant Healthcare:* Early prenatal care and recommended well baby care should be encouraged.
- *Smoking:* Avoid smoking during pregnancy. Create a smoke-free environment around the baby after birth.
- *Safe Sleep:* Parents should be informed about safe sleep practices for infants, including the fact that sleep surface sharing is hazardous, and follow safe sleep recommendations.
- *Breastfeeding:* Mothers should be encouraged to breastfeed. Infants may be brought to bed for nursing, but should be returned to their own crib or bassinet when the parent is ready to return to sleep.

For professionals:

- All pediatric health care professionals should be informed about current recommendations for infant safe sleep, and when working with parents, talk about and model safe sleep practices.
- All child care professionals should be informed, practice and follow Missouri Department of Health and Senior Services, Daycare Licensing Administrative Rules for infant safe sleep.

For community leaders and policy makers:

- Implement and support safe sleep campaigns and current safe sleep practices.
- Require safe sleep education for all licensed child care providers. The American Academy of Pediatrics offers a free “Reducing the Risk of SIDS in Child Care” online course. Instructions on how to access the course can be found at:
<http://www.healthychildcare.org/pdf/SIDSmoduleflyerINSTRUCTIONS.pdf>

For child fatality review panels:

- All sudden unexpected deaths of infants less than one year of age require autopsy by a child death pathologist and review by county CFRP panels.
- Encourage proper scene investigations in all sudden unexpected infant deaths, with use of a death scene investigative checklist, which can be obtained either from STAT’s website at:
<http://dss.missouri.gov/stat/forms.htm>, or from the CDC at:
<http://www.cdc.gov/sids/SUIDHowtoUseForm.htm>.
- Remember that a thorough death scene investigation, autopsy and medical and social review of all available data and information pertaining to any sudden unexpected infant death is of critical importance in identifying risk factors and developing effective prevention strategies.

Something We Can Do: Safe Cribs for Missouri

According to the American Academy of Pediatrics, the Consumer Product Safety Commission and the National Institute of Child Health and Human Development, the safest place for an infant to sleep is in a standard crib, on his or her back without soft bedding, or toys of any kind. Unfortunately, many parents have not received this information and, for a variety of reasons, are unable to provide a safe crib for their infant.

Safe Cribs for Missouri is a program co-funded by the Department of Health and Senior Services and Children's Trust Fund. This program provides portable cribs for low-income families. The mother has to be at least 35 weeks gestation or no more than three months postpartum and WIC eligible. Each county is limited to five cribs per month. As part of the process, parents must agree to prevention education and instruction when receiving the crib. The first visit will be held at time of delivery of the crib and the second visit will be at the home four to six weeks either post partum or after receipt of the crib, to ensure appropriate use. The overall goal of this project is to save infant lives and support families. For additional information, contact your local health care agency.

MOTOR VEHICLE FATALITIES

There were 58 motor vehicle fatalities among Missouri children in 2010. Of those, 55 were reviewed by CFRP panels.

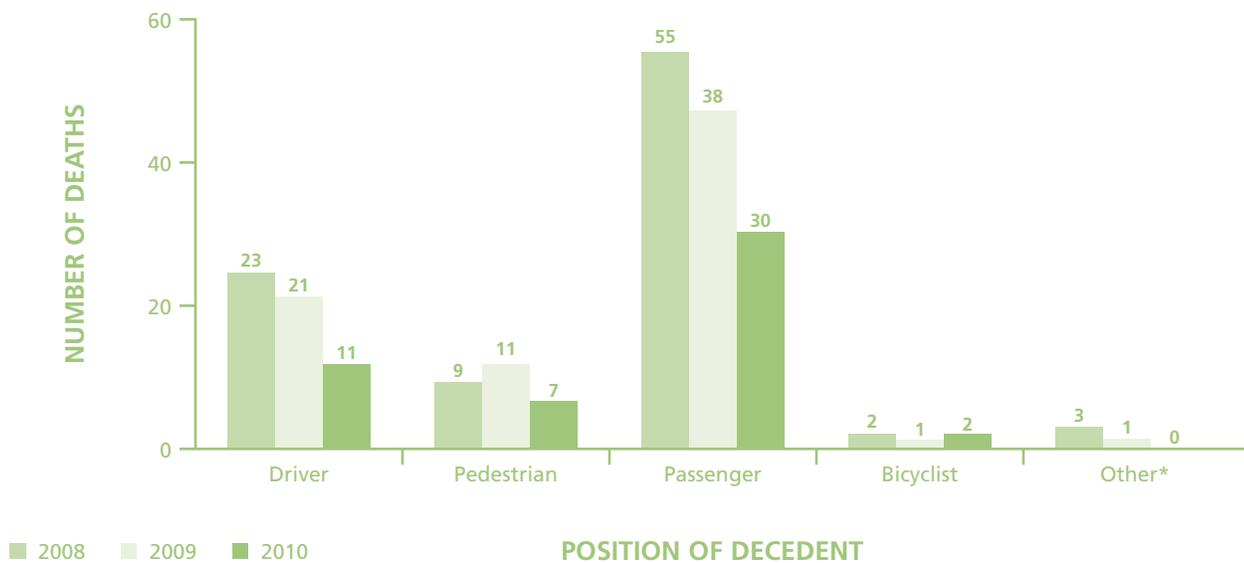

In the United States, motor vehicle crashes are the leading cause of injury deaths for children and adults and the second leading cause of injury death for children ages birth to one. Motor vehicle fatalities include drivers and passengers of motor vehicles, pedestrians who are struck by motor vehicles, bicyclists and occupants in any other form of transportation, including all-terrain vehicles.

Of the 58 motor vehicle deaths among Missouri children in 2010, 55 were reported to the Child Fatality Review Program; of which 50 were reviewed by a local CFRP panel.

MOTOR VEHICLE FATALITIES BY POSITION AT TIME OF INJURY

*In 2008, one child died when the motor vehicle in which she was riding was struck by a tornado, one child died when a car crashed into his house and came to rest on top of him; and a toddler died when she was run over by her mother’s vehicle, which had been knocked out of gear by three-year-old sibling. In 2009, a six-year-old autistic child was run over when he jumped from a vehicle that he had put in neutral, while waiting for his mother in the vehicle.

The good news is that the number of child vehicle deaths has dropped a great deal over the last few years. The National Highway Traffic Safety Administration has stated that number and rate of traffic fatalities in 2010 fell to the lowest levels since 1949, despite a significant increase in the number of miles Americans drove during the year. They go on to state that nationwide, since 2005, fatalities have dropped 25 percent. This reduction has been even higher among Missouri children. The change from 137 vehicle deaths in 2005 to 58 in 2010 makes for a 58% reduction, most of which has come from a significant reduction in driver and passenger deaths.

Driver and Passenger Fatalities

Of the 50 reviewed motor vehicle deaths in Missouri in 2010, 41 (82%) involved drivers and passengers.

Representative Cases:

- Children age four years and under should ride appropriately restrained in a child safety seat.

A four-year-old boy was riding in the front seat on his mother's lap, with the same seatbelt around both of them. The driver failed to stop for a vehicle turning in front of them. The airbags deployed crushing child between airbag and mother.

- The most significant risk factors among teen drivers are inexperience, low rates of seatbelt use and alcohol.

An inebriated seventeen-year old lost control of the car he was driving, sending it over the top of roadside trees and overturning. He was ejected from the vehicle and died from blunt chest trauma.

A seventeen-year old was a passenger in a vehicle being driven by another teen who was impaired. Traveling at a high rate of speed on a gravel road, the driver lost control of the vehicle which overturned, ejecting both the driver and passenger from the vehicle. Neither was wearing seatbelts and both died as a result of accident-related injuries.

The National Center for Injury Prevention and Control lists two factors as most significant in contributing to motor vehicle-related fatalities among children: (1) unrestrained children and (2) drunk drivers. Unrestrained children refer to infants and toddlers who are not riding in properly installed car seats and older children whose seatbelts are not fastened. The National SAFE KIDS Campaign reports that young children restrained in child safety seats have an 80% lower risk of fatal injury than those who are unrestrained. Public education and child restraint laws have led to an increase in the use of child restraints; however, much work still needs to be done. In 2010, 15 of the child passenger fatalities in Missouri were known to be riding unrestrained. The most common reasons restrained children are killed are misuse of child safety seats and premature graduation to seatbelts.

Of the 50 reviewed motor vehicle fatalities, 10 involved either a victim or a driver who was impaired. In 2010, CFRP panels determined that four of these deaths involved a teen victim who was impaired; two of those were the drivers of a vehicle that crashed, one was a passenger and one was a pedestrian. There were four deaths where the driver of the vehicle in which the victim was a passenger was impaired; two of those fatalities involved a teen riding with an impaired teen, two were young children riding with drunken parents. The other two of these 10 deaths involved collisions with other vehicles driven by an impaired driver.

The highest fatality rates are found among teenage drivers. Teenagers are three or four times more likely to be involved in a crash than the driving population at large. According to the National Center for Injury Prevention and Control the most significant risk factors among teenage drivers are inexperience, low rate of seatbelt use and alcohol. Inexperienced drivers lack the perception, judgment and decision-making skills that take practice to acquire.

Graduated licensing for teen drivers must be combined with education for parents and teens about risks to teenage drivers, including the dangers of underage drinking, speeding, inattention and low seatbelt use. The Missouri Graduated Driver's License law "requires that all first-time drivers between 15 and 18 years old complete a period of driving with a licensed driver (instruction permit), and restricted driving (intermediate license), before getting a full driver license." The issuance of a permit ensures that a new driver gets at least 40 hours of supervised driving practice before they are allowed to drive on their own. The intermediate license restricts the number of teens that a new teen driver can have in their vehicle, as well as the hours of day they are allowed to drive.

Seatbelts are known to reduce the risk of fatal motor vehicle injury by as much as 45%. In 2010, 26 (52%) of the reviewed motor vehicle fatalities among children in Missouri, were teenagers age 15-17, 14 were passengers, two were pedestrians and 10 were drivers. Of those, 12 (46%) were known to be unrestrained at the time of the crash.

Pedestrian Fatalities

Of the 50 reviewed motor vehicle fatalities among Missouri children in 2010, seven were pedestrians; three of those were age four and under; the other four were between the ages of 14 and 16.

Representative Cases:

- Young children require constant supervision.

A four-year-old child was left in the care of mother's paramour. He allowed her to cross the street on her own, while he was watching television. The child was struck by a hit and run driver. Neighbors called EMS who transported the child to hospital where she was pronounced.

- Teens need to be reminded of the dangers of crossing busy thoroughfares.

A fourteen-year-old boy and two of his friends were attempting to cross a busy interstate highway. They had safely crossed over the northbound lanes, stopping at the concrete median. The boy was struck by an oncoming vehicle while attempting to cross the southbound lanes.

- Drivers need to be aware of the presence of pedestrians, especially in school zones.

A sixteen-year old was crossing the street. He had a walk light and was in the crosswalk when he was run over by a school bus that was making a left-hand turn. The bus was found to have had condensation on the front and driver's side windows, reducing visibility.

According to the National SAFE KIDS Campaign:

- Children are particularly vulnerable to pedestrian death, because they are exposed to traffic threats that exceed their cognitive, developmental, behavioral, physical and sensory abilities. This is exacerbated by the fact that parents overestimate their children's pedestrian skills. Children are impulsive and have difficulty judging speed, spatial relations and distance.
- Toddlers (ages 1 to 2) sustain the highest number of pedestrian injuries, primarily due to their small size and limited traffic experience. More than half of all toddler pedestrian injuries occur

when a vehicle is backing up. Young children are at increased risk of pedestrian death and injury in driveways and other relatively protected areas.

- Children ages 14 and under are more likely to suffer pedestrian injuries in areas with high traffic volume, a higher number of parked vehicles on the street, higher posted speed limits, no divided highways, few pedestrian-control devices and few alternative play areas.
- Practical, skills-based pedestrian safety training efforts have demonstrated improvements in children's traffic behavior. Environmental modifications are effective at reducing traffic-related pedestrian incidents.

While young children are vulnerable to pedestrian accidents due to their inexperience, teens are vulnerable due to their impulsiveness and risk-taking behavior. Teens are more at risk if they are in groups, or if they have been consuming alcohol. **Four** of the **seven** pedestrian deaths were children ages 14 and above. Alcohol was a factor in one of these deaths, while **two** were with other teens and were struck in the roadway.

Bicycle-Related Fatalities

By definition, motor vehicle fatalities include bicycle-related injuries that occur when children are either struck by a motor vehicle or fall. Of the **50** reviewed motor vehicle fatalities among Missouri children in 2010, **two** were bicyclists of which neither was wearing a helmet.

Representative Cases:

- **Children should always wear a properly fitted helmet when riding a bicycle.**

A seven-year-old child rode his bicycle out of the driveway into the path of a vehicle. The child was not wearing a helmet and died due to severe head injuries.

That National SAFE KIDS Campaign states, with the exception of the automobile, bicycles are associated with more childhood injuries than any other consumer product. Head injury is the leading cause of death in bicycle crashes and is the most important determinant of bicycle-related death and permanent disability. Scientific evidence has shown that the single most effective safety device available to reduce head injury and death from bicycle crashes is a helmet. In the event of a crash, wearing a bicycle helmet reduces the risk of head injury by as much as 85% and the risk of brain injury by as much as 88%.

Children ages 10 to 14 are at greater risk for traumatic brain injury from a bicycle-related crash compared with younger children, most likely because helmet use declines as children age. More than 80% of bicycle-related deaths are directly connected to the bicyclist's actions. Such actions as riding into a street without stopping, turning left or swerving into traffic that is coming from behind, running a stop sign and riding against the flow of traffic are all-too common, and are often fatal. Children should be taught the rules of the road and to obey all traffic laws.

Motorcycle Fatalities

One Missouri child died in a motorcycle accident in 2010. This child was the operator of the motorcycle and was not wearing a helmet.

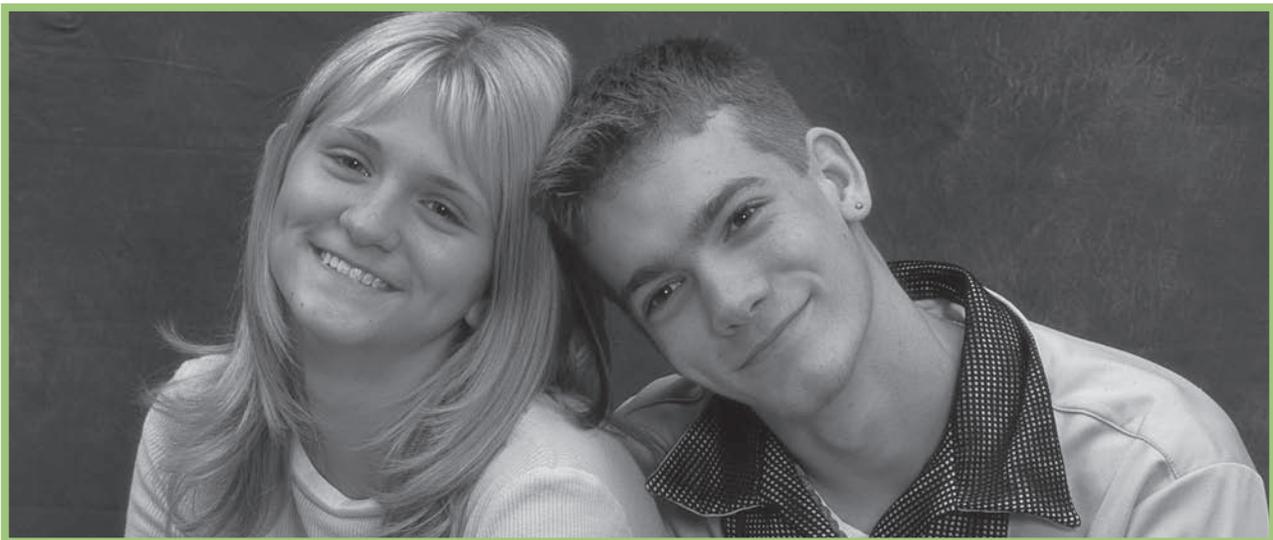

Representative Cases:

- Everyone should wear helmets when operating or riding on a motorcycle or other motorized bike.

A nine-year old was riding a mini bike with his 12-year-old brother. They were crossing the road in front of their home after dark. A truck struck them from behind causing massive head injuries and instant death to the younger child. The brother was lifeflighted to a hospital. Neither child was wearing a helmet.

The dangers of inexperience and inattention are of a higher degree of risk when involving motorcycles and other smaller motorized vehicles, such as ATVs. Such vehicles generally have a short and relatively unstable wheelbase, small tires, slow acceleration, borderline brakes, and poor visibility in traffic (both of the cycle and by the cycle operator). The American Academy of Pediatrics states that typically injuries on these types of vehicles are the result of “loss of control of the cycle after striking rocks, bumps, holes or from illegal on-road use.” Parents and other caregivers need to realize that even a small 50cc mini-bike can have a top speed of 50-90 mph. Missouri requires the use of motorcycle-style helmets for both off and on-road use.

The National Highway Traffic Safety Administration (NHTSA) advocates graduated licensing for motorcycle operators, because it compels novice operators to successfully demonstrate proficiency at several intermediate steps before being granted full riding privileges. They also recommend that motorcycle riders under the age of 21 complete a rider education course before receiving a license.

All-Terrain Vehicle Fatalities

One Missouri child died in an ATV accident in 2010. This child was the operator of the ATV and was not wearing a helmet.

Representative Cases:

- Alcohol and 4-wheelers do not mix.

A seventeen-year old died when he hit head on with a friend on an ATV. Both teens had been drinking and they were playing "chicken."

ATVs are motorized cycles, with 3 or 4 balloon-style tires, designed for off-road use on a variety of terrains. By the nature of their design, ATVs can be unstable due to their high center of gravity, inadequate suspension system, no rear-wheel differential, and of further hazard due to their weight and ability to reach higher speeds. According to the Consumer Product Safety Commission, in the United States, children account for nearly one-third of all ATV-related injuries. The American Academy of Pediatrics states that most injuries associated with ATVs occur when the driver loses control, the vehicle rolls over, the driver or passenger is thrown off, or there is a collision with a fixed object. Head injuries account for most of the deaths. The child who died in 2010 was not wearing a helmet.

It is recognized by many safety organizations that children do not have the cognitive and physical abilities to drive or ride these vehicles safely. National SAFE KIDS Campaign states that currently, 27 states have a minimum age requirement for operation of an ATV. Missouri is one of only three states that require ATV operators to be 16 years of age or older.

Farm Vehicle Fatalities

Farm machinery is inherently dangerous, their large size and various cutting and shredding implements make them a danger to anyone using them, but this is especially true of children. Young children often ride along with their parent's in the cab of tractors or other machinery, but these vehicles are not designed for passengers. In 2010, one child died in Missouri when the child managed to unlatch the door of the cab of a tractor he was riding in and fell out under the wheels.

Helping out on the farm is a tradition for many Missouri children, but in many cases children are given duties for which they are not yet mentally or physically prepared. While they may be fine in most instances, their immature decision-making skills can get them into trouble if something untoward happens. In 2010, one young teen died when he lost control of the tractor he was driving.

Other Vehicular Fatalities

Motor vehicle fatalities include drivers, passengers and pedestrians fatally injured in or by any form of transportation. In 2010, one Missouri child died as a result of injuries involving vehicles listed as "Other." This child was riding in a bus that was involved in a multi-vehicle pileup on a highway.

Prevention Recommendations:

For parents:

- Children, 12 years old and younger, should always ride appropriately restrained in the back seat of all passenger vehicles, particularly vehicles with airbags.
- Children under eight should ride in a booster seat, unless they are 80 pounds or 4'9" tall.
- Children should always wear a helmet when participating in any wheeled activities, including bicycles, skateboards, inline skates, scooters, etc.
- Never allow children under age 12 to cross streets alone.
- Always model and teach proper pedestrian behavior.
- Children under the age of 16 should never ride or operate ATVs of any size, including youth-sized ATVs.
- Never leave children alone in a motor vehicle, even when they are asleep or restrained.
- Each person riding on a personal watercraft (PWC) must wear a US Coast Guard–approved Type I, II, III, or V Personal Flotation Device (PFD).

For community leaders and policy makers:

- Community leaders should encourage enforcement of existing child restraint laws.
- Missouri lawmakers should strengthen child restraint laws by mandating the following:
 - Include children age four through 15 in the child restraint law; thereby, making restraint use in the age group subject to primary enforcement.
 - Raise the penalty for violation of child restraint laws to at least \$100 and one driver's license point.
 - Remove the provision of the vehicle equipment regulations that states if there are not enough safety belts for all passengers, they are not in violation for failure to use.

For professionals:

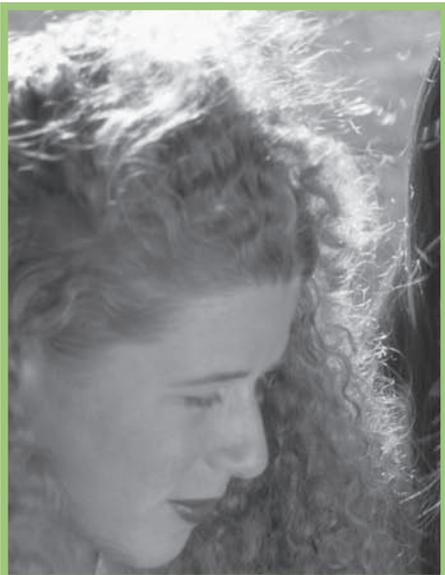

- Facilitate and implement programs that educate parents on appropriate restraint of children in motor vehicles and provide child safety seats to those do not have them. Child safety seat checkup events are a good place to start.
- Facilitate and implement programs that educate parents on helmet use, instructions on fitting helmets properly and events that provide checkups and helmets at little or no cost.

For Child Fatality Review Panels:

- Review all vehicle-related deaths looking for prevention messages for your community, as well as addressing appropriate concerns related to signage, visibility and/or roadway maintenance.
- Ensure that speed limits, and laws that prohibit driving while intoxicated, along with other traffic safety laws, are strictly enforced.

Keeping Children Safe In and Around Motor Vehicles

Attention concerning child safety and motor vehicles has focused largely on protecting children as they ride in and on vehicles of all kinds, primarily motor vehicles on public roads. The Missouri CFRP reviews and collects data on motor vehicle fatalities among children as passengers, drivers, pedestrians and bicyclists. However, children who are unsupervised in or around motor vehicles that are not in traffic are at an increased risk for injury and death.

The Centers for Disease Control (CDC) examined injuries and fatalities among children involved in non-traffic, motor vehicle-related incidents from July 2000 through June 2001, and documented 78 fatal injuries. Of the fatally injured children, 42% were less than four years of age. The most common type of fatal incident was exposure to excessive heat inside a motor vehicle, followed by being backed over and being hurt when a child put a motor vehicle into motion.

The CDC study recommends several areas for possible prevention, including education campaigns aimed at parents and caregivers, that should communicate the following: 1) ensure adequate supervision when children are playing in areas near parked motor vehicles; 2) never leave children alone in an motor vehicle, even when they are asleep or restrained; and 3) keep motor vehicles locked in a garage or driveway, and keep keys out of children's reach.

Harrison's Hope maintains a national database to evaluate the circumstances and consequences of leaving children unattended in or around motor vehicles. Go to <http://www.harrissonshope.org> for more information.

Something We Can Do: "Not Even for a Minute" Campaign

The Children's Trust Fund (CTF) points out that a child left alone in an automobile is a car accident that can be prevented. For additional information, or to order education materials, contact CTF at 573-751-5147 or visit www.ctf4kids.org.

UNINTENTIONAL SUFFOCATION/STRANGULATION, CHILDREN AGE ONE YEAR AND OLDER

In 2010, there were six unintentional suffocation/strangulation deaths among Missouri children age one year and older.

Representative Cases:

- Parents and caregivers often underestimate the degree of supervision required by young children.

A one-year-old child started choking while his aunt and grandmother were in the kitchen cooking. Emergency services were contacted thru 911. The child was taken to the hospital where he was pronounced. A plastic flower was removed from his throat by hospital personnel.

A two-year-old child was found unresponsive near a mattress on the floor in the babysitter's bedroom. A small domino was pulled from child's mouth, but he could not be resuscitated.

Note: The suffocation/strangulation deaths as reported in this section are unintentional. Suffocation/strangulation deaths may also be intentional, inflicted by others (homicide), self-inflicted (suicide) or of an undetermined manner and are addressed in other sections.

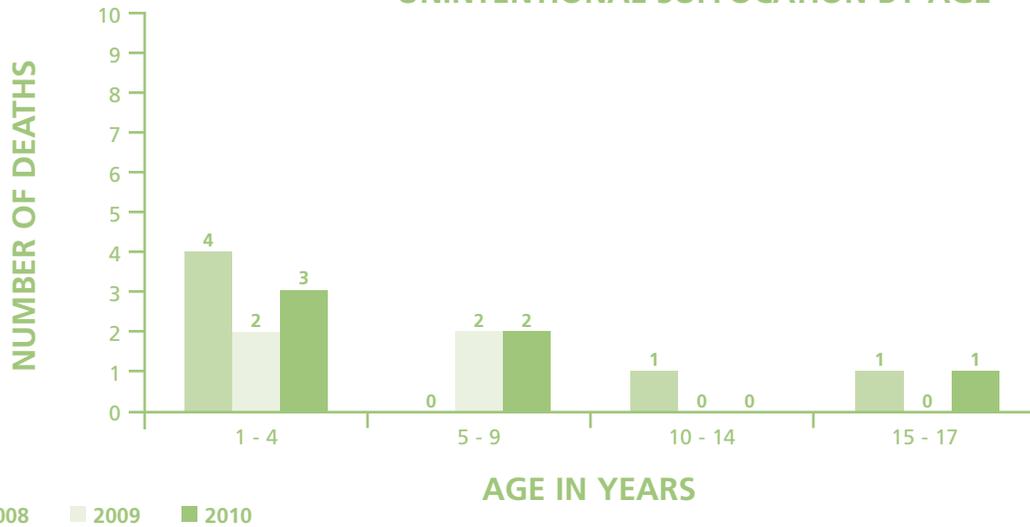

Airway Obstruction Injuries Among Young Children: Choking, Suffocation and Strangulation

According to the National SAFE KIDS Campaign, airway obstruction occurs when children are unable to breathe normally because food or objects block their internal airways (choking), materials block or cover their external airways (suffocation) or items become wrapped around their necks or exert pressure on neck and interfere with breathing (strangulation). Children, especially those under age three, are particularly vulnerable to airway obstruction death and injury due to their small upper airways, their relative inexperience with chewing and their natural tendency to put objects in their mouths.

In Missouri in 2010, **six** children age one year and older died of unintentional airway obstruction injuries. Of those, **three** were ages one to four years. The majority of childhood choking injuries are associated with food items. Children are at risk from choking on small, round foods such as hot dogs, candies, nuts, grapes, carrots and popcorn. Children can easily choke or aspirate small objects, most often toys, beads, balloons and coins.

Airway obstruction injuries can also result from entanglement or entrapment. Children strangle in openings that permit the passage of their bodies, yet are too small for and entrap their heads. These include spaces in bunk beds, cribs, playground equipment, baby strollers, carriages and high chairs. Children can also become entangled in clothing drawstrings and window covering cords, resulting in strangulation. Young children can become entrapped or wedged in a small space, such as between a wall and bed or mattress. They can also become entrapped in airtight spaces such as a cedar chest, unused refrigerator or freezer.

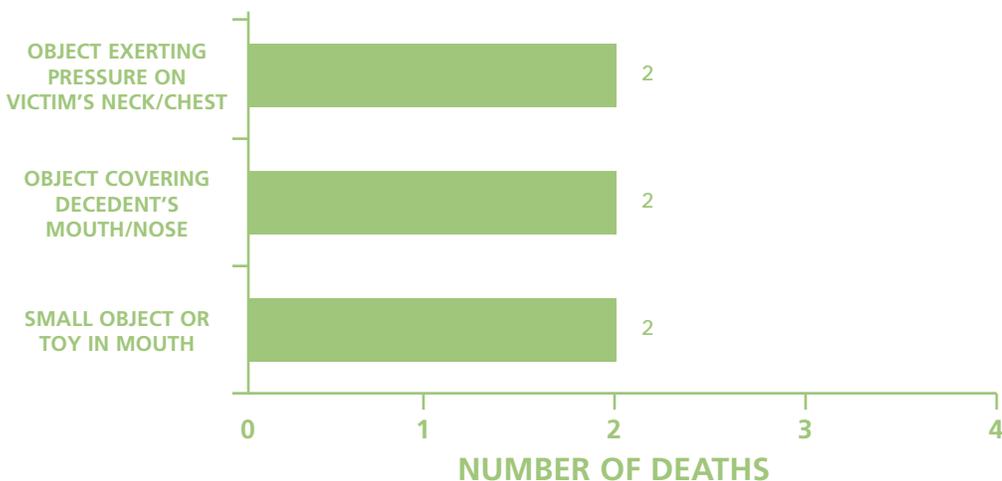

UNINTENTIONAL SUFFOCATION BY AGE

UNINTENTIONAL SUFFOCATIONS ONE YEAR OR OLDER BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	2	2	2	WHITE	6	4	5
MALE	4	2	4	BLACK	0	0	0
				OTHER	0	0	1
	6	4	6		6	4	6

CAUSE OF UNINTENTIONAL SUFFOCATION/STRANGULATION DEATHS IN CHILDREN ONE YEAR OR OLDER

The Child Safety Protection Act bans any toy intended for use by children under age three that may pose a choking, aspiration or ingestion hazard and requires choking hazard warning labels on packaging for these items when intended for use by children ages three to six. To address such hazards, the Consumer Product Safety Commission (CPSC) has issued mandatory standards for bunk beds, as well as voluntary guidelines for drawstrings on children’s clothing to prevent children from strangling in the neck and waist drawstrings of upper outerwear garments, such as jackets and sweatshirts.

Prevention Recommendations:

For parents:

- Remove drawstrings from children’s clothing.
- Tie up or remove all cords for window covers.
- Buy only age-appropriate toys.
- Learn CPR and the Heimlich Maneuver for infants and children.

For community leaders and policy makers:

- Support legislation that requires improved product design, or removal of hazardous products from the market.

For professionals:

- Information about unintentional suffocation/strangulation hazards to young children, including unsafe sleep practices, should be widely disseminated.
- Teach parents CPR and the Heimlich Maneuver for infants and young children.

For Child Fatality Review Panels:

- Report any child death that appears to involve a product hazard to the Consumer Product Safety Commission 1-800-638-2772. The CPSC can also be accessed for product safety research assistance.

UNINTENTIONAL FIRE/BURN FATALITIES

In 2010, 13 Missouri children died of unintentional fire/burn fatalities.*

*Note: Six additional children died of fire/burn injuries, but the manner of death in one of those deaths was homicide and could not be determined in the five others, so information on those deaths are not included in this section.

Representative Cases:

- All fire sources should be kept out of the hands of children.

A two-year-old child died in a fire started by her sibling playing with matches. The child, in full cardiac arrest, was removed from her bedroom by firefighters. The child was transported to the hospital, but medical staff was unable to resuscitate her.

- All residences should have working smoke and carbon monoxide detectors.

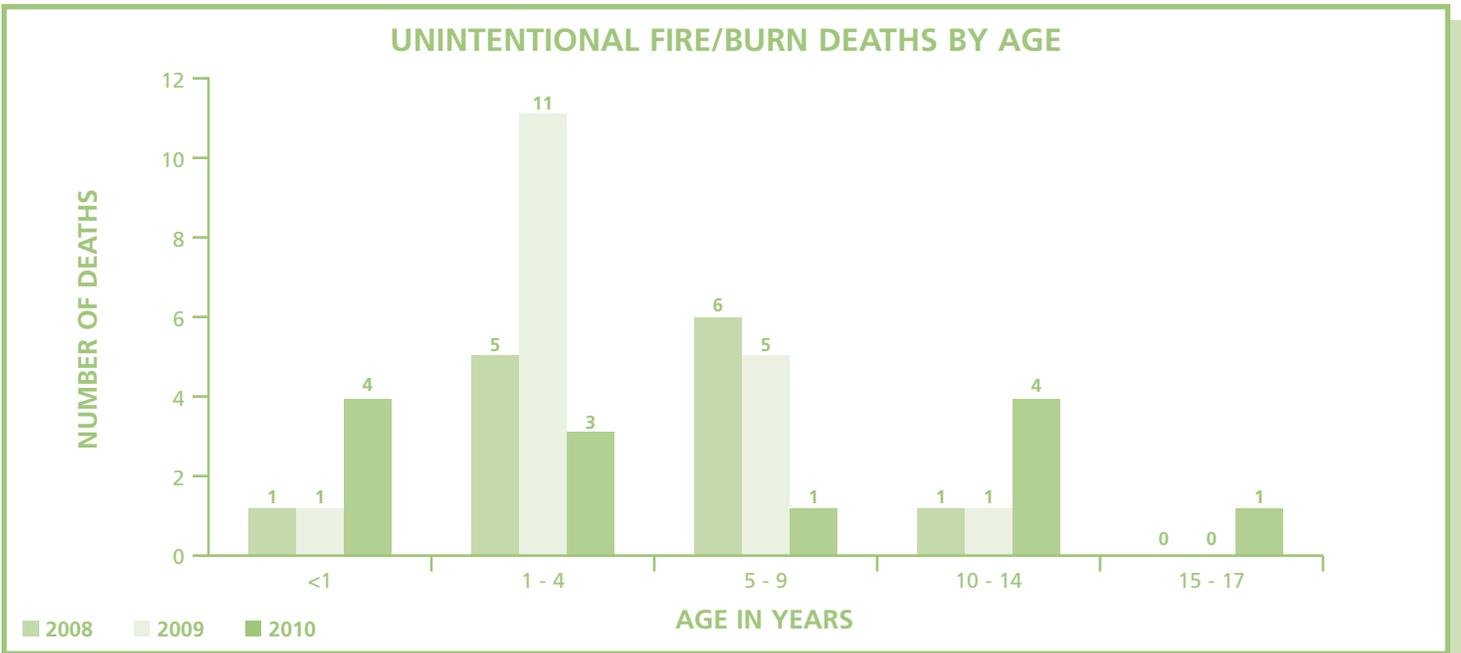

Three children, two ages eleven and one less than one, died in a house fire. The fire marshal ruled that it was caused by an unattended fireplace in the basement. There were no smoke detectors in the home.

Two children, ages fourteen and less than one, died in a fire caused by a space heater. There were no working smoke detectors, and the electricity and gas were shut off to the home.

Each year in the United States, over 475 children ages 14 and under die and nearly 117,000 are injured in fires. Fires and burns are the third leading cause of unintentional death among children aged one -14 years, as reported by the National SAFE KIDS Campaign.

Fire/Burn Deaths Among Children

U.S. Fire Administration states that based on 2003-2007 experience data, children under age five are at highest risk of death from home fires, with males being at greater risk of death and injury than females. Of the 13 fire/burn fatalities among children in Missouri in 2010, seven were under the age of five. Young children have a less acute sense of danger or understanding of how to quickly and properly react to a fire or life-threatening burn situation. It is often more instinctual for a child to “hide” from a fire, than try to escape. They are also less physically able to tolerate toxic combustion, rendering them more susceptible to fire-related asphyxiation. Additionally, younger children have thinner skin, causing them to be more susceptible to severe burns and scalding at lower temperatures, than what would still be considered tolerable by many adults.

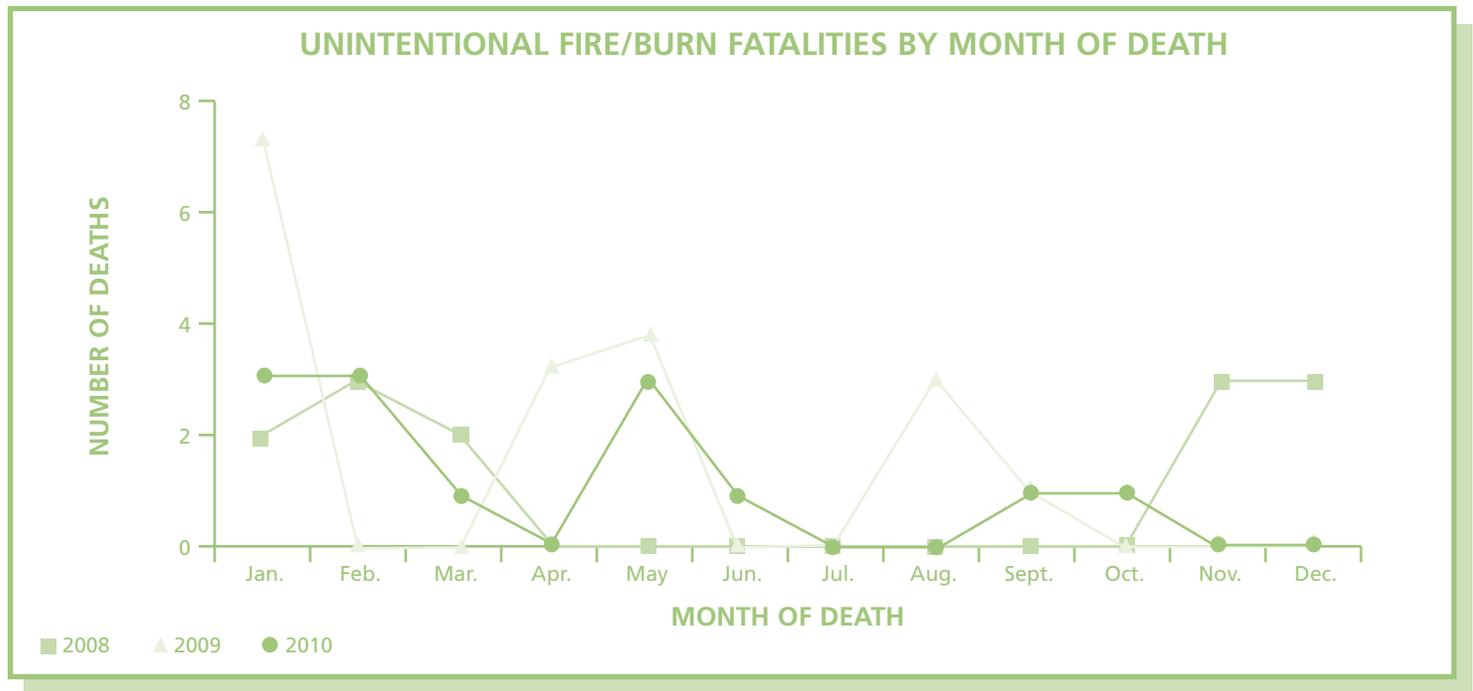

UNINTENTIONAL FIRE/BURN DEATHS BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	6	8	10	WHITE	10	13	10
MALE	7	10	3	BLACK	3	5	2
				OTHER	0	0	1
	13	18	13		13	18	13

Children from low-income families are at greater risk for fire-related death and injury, due to factors such as a lack of working smoke alarms, substandard housing, use of alternative heating sources and economic constraints on providing adequate adult supervision. Children living in rural areas have a dramatically higher risk of dying in a residential fire, primarily due to the types of winter heating used. Death rates in rural communities are more than twice the rates in large cities, and more than three times higher than rates in large towns and small cities.

Although 90% of all residences have smoke alarms today, no smoke alarms were present in 42% of residential structure fires where fatalities occurred. Smoke alarms were reported to be present in only **five** of the **13** fatal Missouri fires reviewed by county CFRP panels in 2010, of those only **two** were known to be in working order. Smoke alarms have been promoted as an invaluable tool for preventing fire and burn injury. Nationwide increases in the prevalence of smoke alarms in homes, and the passage of smoke alarm legislation requiring smoke alarms for new and existing dwellings, partly explain the downward trend in the fire and burn death rate.

Intensive public education campaigns by federal agencies such as the CPSC and U.S. Fire Administration, national organizations and fire departments that promote residential fire safety and burn prevention have played a role in reducing the death rate from fire and burn injury. The regulation of various fire and burn-related products and enforcement of standards through the Flammable Fabrics Act by the CPSC, have had a significant impact on child safety.

Juvenile Firesetting

“The first step in solving the problem is to understand better which children set fires and why they do it.” U.S. Fire Administration

Children playing with fire caused 40% of the residential fire-related deaths among children. Almost half (42%) of home structure fires begin in the bedroom, where children are often left alone to play. In Missouri in 2010, **one** child was known to have died in a fire started by other children playing with fire. In a typical year, fires set by children and youth claim the lives of approximately 300 people and destroy more than \$300 million worth of property, nationwide. Children are the predominant victims of these fires, accounting for 85 of every 100 lives lost.

The United States Fire Administration identifies four categories of juvenile firesetters: Curiosity/Experimental, Troubled/Crisis, Diligent/Criminal and Pathological/Emotionally Disturbed. Curiosity/Experimental firesetters usually consist of boys and girls ages two to 10, who lack understanding of the destructive nature of fire. The Troubled/Crisis firesetters are mostly boys of all ages who have set two or more fires. These firesetters use fire as a way to express emotion - anger, sadness, frustration or powerless feelings concerning stress or major changes in their life. They may not understand the consequences of uncontrolled fire and most of them will likely continue to set fires until their needs are met or identified. These firesetters are also known as “cry for help” firesetters.

The Delinquent/Criminal firesetter is usually a teen with a history of firesetting, gangs, truancy, antisocial behavior, or drug/alcohol abuse. These firesetters usually set fires with the intent to destroy, or as acts of vandalism and malicious mischief. For a child to be categorized as a Pathological/Emotionally Disturbed firesetter, involves a psychiatric diagnosis. The fires they set may be random, ritualized, or with specific intent to destroy property. These firesetters can be of any age, and usually have a chronic history of school, behavioral and social emotional problems.

Regardless of motivation, firesetting behavior must always be taken very seriously. The U.S. Fire Administration recommends that parents contact their local fire department or state fire marshal for help. Local fire departments throughout the state are adopting various approaches to critical elements of prevention: 1) identification/referral of the firesetter, 2) evaluation and 3) intervention.

Something We Can Do: Fire Prevention Awareness Day

When three children died in a house fire in St. Louis, CFRP panel members and other community leaders talked about finding a way to target that neighborhood for a fire safety campaign providing appropriated prevention response to those tragic deaths. Smoke detectors, properly installed, and maintained, have proven extremely effective in preventing fatalities. Annually since 1995, volunteers have brought "Fire Prevention Week" to high-risk neighborhoods throughout the region. Since August 2006, the St. Louis Fire Department has installed 18,749 smoke alarms in 8,708 homes, protecting 18,422 citizens. Many other fire departments statewide are also actively participating in fire safety awareness campaigns in their local communities. Media attention to these events help spread the prevention message.

Prevention Recommendations:

For parents:

- Young children require vigilant supervision.
- Keep matches, gasoline, lighters and all other flammable materials locked away and out of children's reach.
- Install smoke alarms on every level and in every sleeping area. Test them once a month. Replace the batteries at least once a year.
- Plan and practice fire escape routes from each room of your home and identify an outside meeting place. Practicing an escape plan may help children who become frightened and confused in a fire, to escape to safety.

For community leaders and policy makers:

- Enact laws that require smoke detectors in new and existing housing, and making landlords responsible for ensuring that rental properties have working smoke detectors.
- Enforce building codes and conduct inspections.

For professionals:

- Smoke detector giveaway programs have proven useful when high-risk areas are targeted. Implement such programs in your community.
- Implement a multi-faceted community campaign to prevent burn injuries. Target a well-defined population with a very specific message.

For Child Fatality Review Panels:

- When reviewing a child death resulting from a residential fire, determine if the local building code requires smoke detectors in residence, and if a working smoke detector was present in the home. Use that information to develop an action plan; i.e., work to establish or change building codes or pursue prosecution, if negligence or lack of appropriate supervision occurred.

UNINTENTIONAL DROWNINGS

In 2010, 20 total children drowned in Missouri

Representative Cases:

- **Small children need constant supervision.**

A five-year-old child was riding a tricycle around the pool in grandparent's backyard. Mother went into the house for approximately five minutes. When she came back out, she found that the child had fallen into the pool.

A one-year-old child fell into the family pool while unsupervised. His teenage aunt and uncle both thought the other was watching the child. He got out of the house through the garage and went to the gated pool (unknown if gate was already open), where he was discovered floating in the pool.

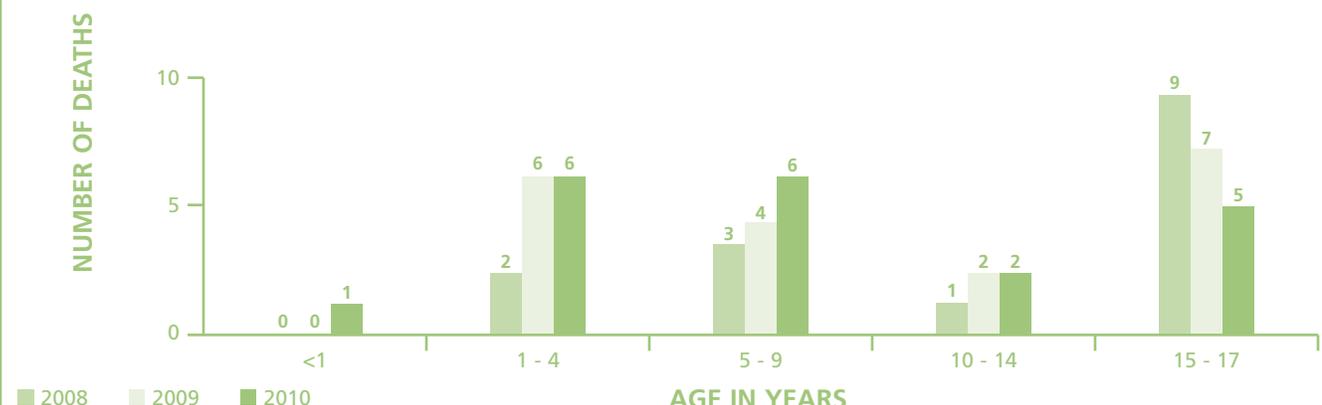

- **U.S. Coast Guard approved personal flotation devices should be worn at all times in and around open water.**

There was a family gathering by a river where an eddy runs under the water in that location. No swimming signs were posted, but were being ignored. A seventeen-year-old boy got caught in the eddy and was pulled under. His body was found an hour later.

A father and his eight-year-old son went out to go fishing on a lake in colder weather. The water temperature was 46 degrees and the lake had had 2-3 foot swells, which probably capsized the boat. Neither was wearing personal flotation devices, as the life vests were found in the recovered boat.

In the United States, drowning is the second leading cause of unintentional injury-related death among children ages one to 14 and the leading cause of unintentional injury-related death among children ages one to four, according to the National SAFEKID Campaign. Of the **20** Missouri children who drowned in 2010, **seven** (35%) were age four and under.

UNINTENTIONAL DROWNING DEATHS BY AGE

UNINTENTIONAL DROWNINGS BY SEX AND RACE

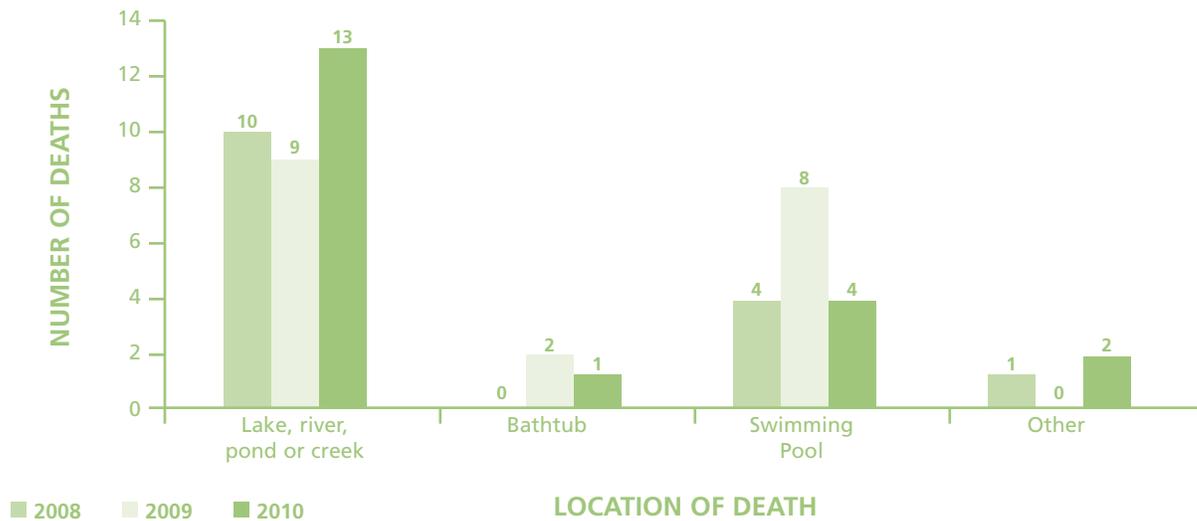

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	2	7	2	WHITE	11	15	19
MALE	13	12	18	BLACK	4	4	1
	15	19	20		15	19	20

Most drownings among infants under the age of one occur in bathtubs, while most drownings among children ages one to four occur at pools. Young children can drown in as little as one inch of water; therefore, they are at risk of drowning in wading pools, bath and hot tubs, buckets, diaper pails and toilets. The head of an infant or toddler is disproportionately large and heavy, representing approximately 20% of the total body weight, making them top-heavy and unable to escape when head-first in a toilet or bucket.

Older children are more likely to drown in open water locations such as creeks, lakes and rivers. Of the 20 Missouri children who drown in 2010, four (20%) occurred in swimming pools, thirteen (65%) occurred in open water locations, one (5%) occurred in a bathtub, and two (10%) occurred in “other” locations (a rock quarry and a decorative goldfish pond).

A child drowning can occur quickly and silently in a matter of seconds, and typically occurs when a child is left unattended or there is a brief lapse in supervision. Even the belief that a drowning victim will make lots of noise, while thrashing around in the water before actually drowning, is not accurate.

UNINTENTIONAL DROWNINGS BY LOCATION

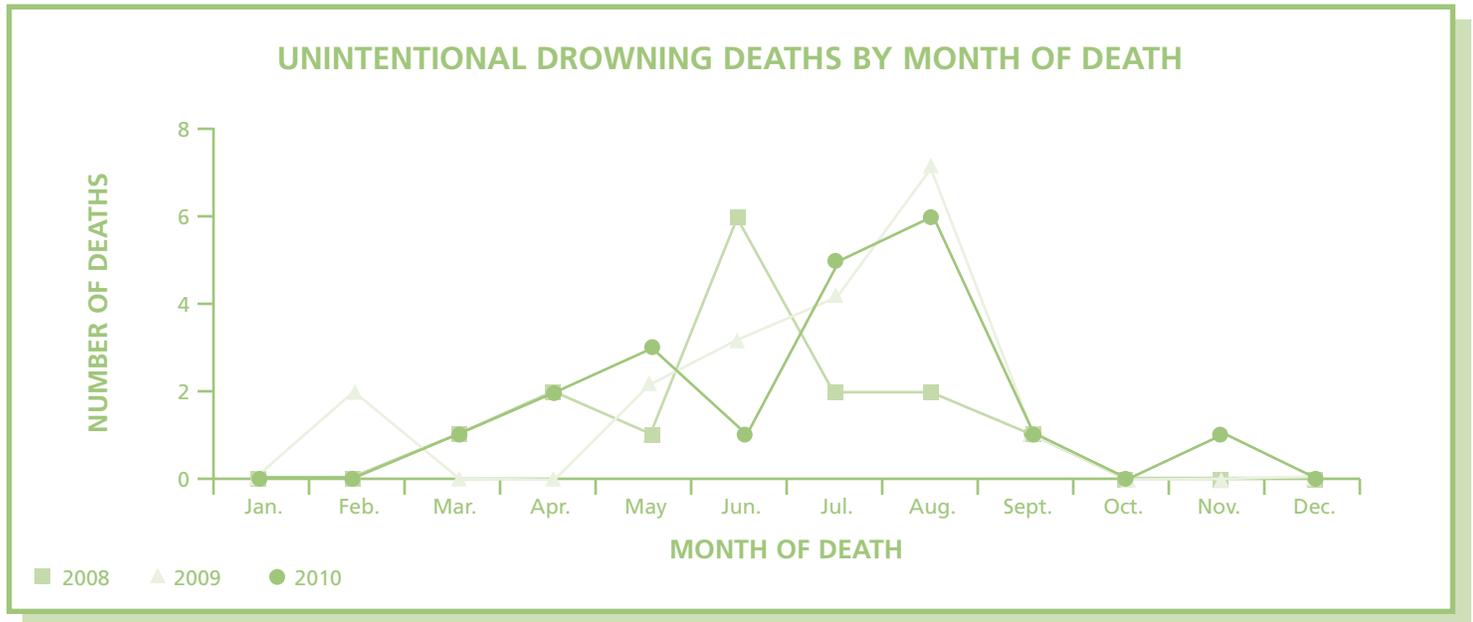

Drowning Deaths Among Children

Supervision of children in and around water is critical. Eighteen of the 20 drowning fatalities in 2010, in which supervision of the child was a consideration, panels found that 10 (55%) had entered the water unattended.

Use of a personal flotation device is well established as an effective means to prevent drowning deaths. **None** of the Missouri children who drowned in 2010, were wearing a personal flotation device.

The warm weather months of May, June, July and August are peak months for drowning, coinciding with increased activity in swimming pools and open water locations.

Prevention Recommendations:

For parents:

- Never leave a child unsupervised, even for a minute, in or around water in the home or outdoors.
- For families with residential swimming pools, install four-sided pool fencing with self-closing and self-latching gates. The fence should be at least four feet tall and completely separates the pool from the house and play area of the yard.
- Ensure that children always wear U.S. Coast Guard approved personal flotation devices when near or around open water locations.
- Learn CPR.

For community leaders and policy makers:

- Enact and enforce pool fencing ordinances.
- Enforce existing regulations regarding the use of personal flotation devices when boating.

For professionals:

- Parents, as well as children, should receive water safety education, to include discussion of in-home water hazards to children (including buckets, toilets, etc.) and the importance of vigilant supervision.
- Facilitate CPR training for parents of small children.

For child fatality review panels:

- Promote public education about drowning hazards to children and strategies to prevent drowning.

UNINTENTIONAL POISONING

In 2010, 10 Missouri children died of unintentional poisoning*.

*Note: Three additional children died of poisonings, but the manner of death in one of those deaths was homicide and two others were suicide, so information on those deaths are not included in this section.

Representative Cases:

- Homes should have working smoke and carbon monoxide detectors.

The parents and two children, ages three and four years, died of carbon monoxide poisoning from a faulty furnace. The whole family had been complaining of headaches and nausea for a week, but no one realized that these symptoms could be caused by carbon monoxide.

A seventeen-year-old child with a history of asthma was living with her grandmother in a 4-plex. Their neighbor called the fire department due to the smell of gas. A running vehicle was found in the garage. The child was found dead in an upstairs bedroom, the other two people in the home were taken to the hospital.

- Teens and drugs are a deadly combination.

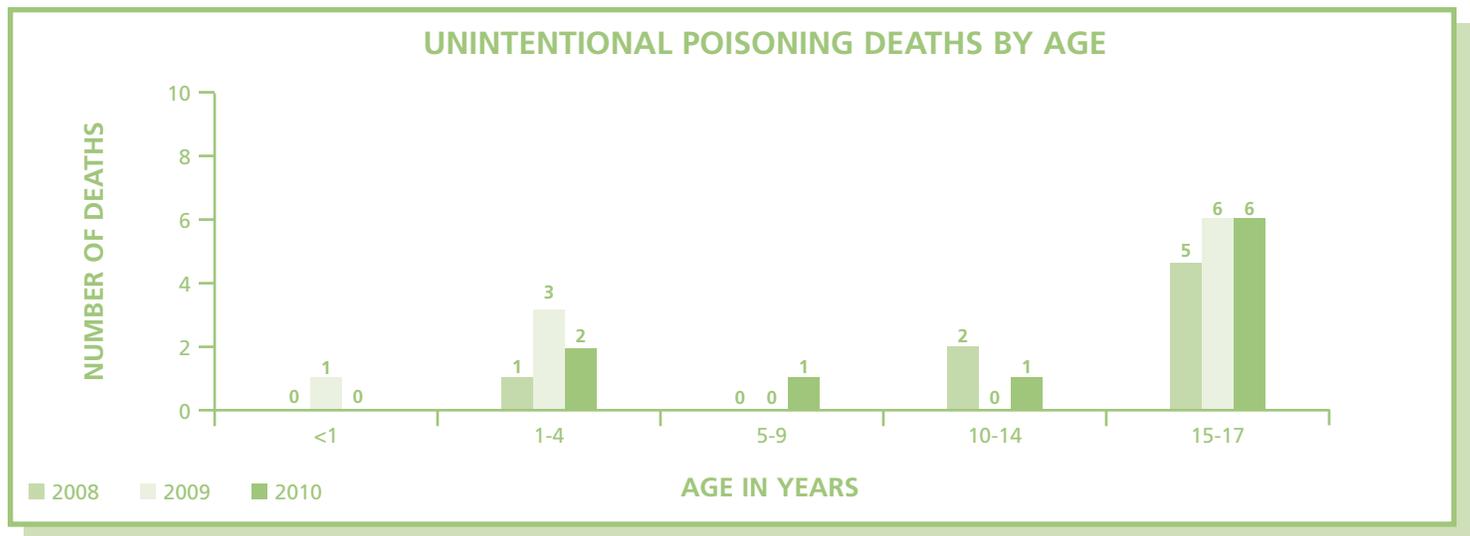

A seventeen-year old who was spending the weekend with his father, obtained OxyContin from a family member's prescription without their knowledge. He died of an overdose of the drug.

A poison is a substance that is harmful to the body when ingested, inhaled, injected or absorbed through the skin. Children are at risk of poisoning from household and personal care products, medications, vitamins, indoor plants, lead and carbon monoxide.

In 2010, **ten** Missouri children died of unintentional poisoning. **Two** children ages 1-4 died of carbon monoxide poisoning and **one** six-year-old child died from an overdose of prescription medications. According to the National SAFE KIDS Campaign, 60 percent of poisoning exposures to children under the age of five are by non-pharmaceutical products such as cosmetics, cleaning substances, plants, foreign bodies and toys, pesticides, art supplies and alcohol; with the remaining 40 percent by pharmaceuticals.

Unintentional childhood poisoning deaths have declined over the past decade, largely due to child-resistant packaging, heightened parental awareness, Consumer Product Safety Commission regulations concerning lead-free products, and appropriate interventions by poison control centers and health professionals.

The Missouri Poison Center is an informational resource and provides statewide services 24-hours a day, 7-days a week, is professionally staffed by nurses, pharmacist and physicians, and most of all, is free to the public, either by <http://www.cardinalglennon.com/pages/poison%20center.aspx> or toll free number 1-800-222-1222.

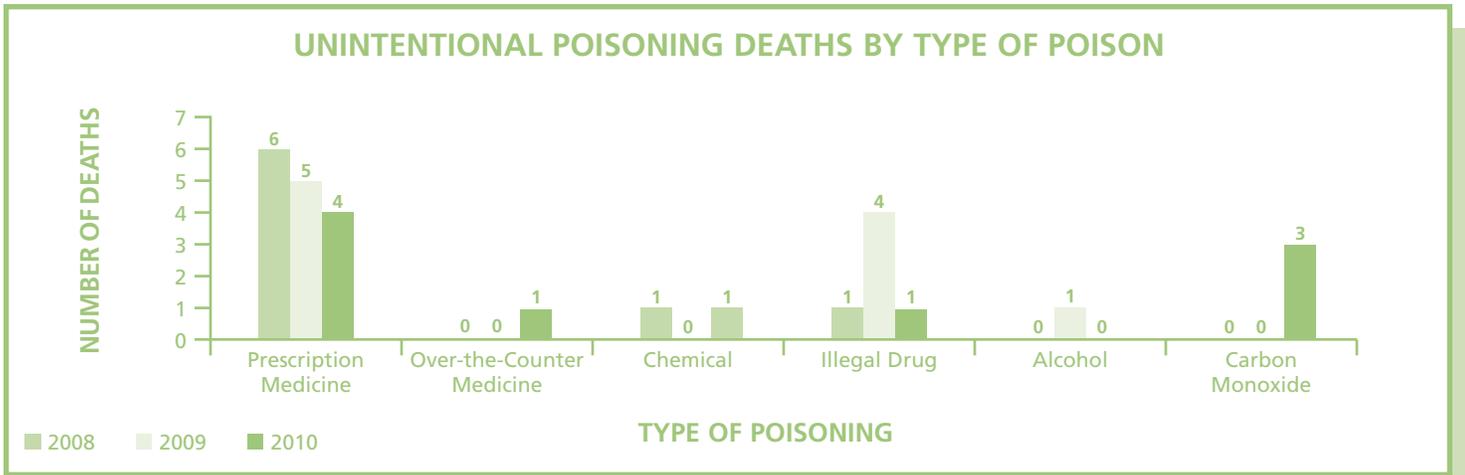

UNINTENTIONAL POISONING DEATHS BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	4	0	3	WHITE	8	6	10
MALE	4	10	7	BLACK	0	3	0
				OTHER	0	1	0
	8	10	10		8	10	10

Seven Missouri teens, ages 14-17, died of unintentional poisoning in 2010, three overdosed from prescription medications from various sources, one overdosed on an over-the-counter medication, one died from illegal drugs, one died from huffing and one died of carbon monoxide poisoning.

According to the Office of National Drug Control Policy (ONDCP), any illicit drug use more than doubles between 8th and 10th grade, from 8.1 percent to 17.8 percent. By the time students are seniors; this rate of illicit drug use has climbed to 23.3 percent. The pattern for alcohol use is similar. Rising from 14.9 percent to 30.4 percent between 8th and 10th grade, and by the time students are seniors, the rate of current alcohol use has reached an alarming 43.5 percent. Research tells us that the brain is still developing during adolescence, particularly those areas that control decision making. Parents and other adults need to know that these are vulnerable years for their children. Be aware of the warning signs of substance use and know what can be done to help prevent children from ever starting to use these substances.

A number of national studies and published reports indicate that the intentional abuse of prescription drugs to get high is a growing concern. Among teens, prescription drugs have become the second most abused illegal drug, behind marijuana. According to Substance Abuse and Mental Health Services Administration (SAMSHA), emergency room visits related to nonmedical use of pharmaceuticals, increased 60 percent in the period from 2004 to 2007.

Prevention Recommendations:

For parents:

- Parents should educate themselves and their teens about the risks associated with prescription and over-the-counter drug abuse.
- When using prescription medications, parents and children should follow directions carefully and properly discard old or unused medications.

For community leaders and policy makers:

- Advocate for mandatory child-resistant packaging on all hazardous drugs and household products.
- Pass carbon monoxide detector use laws.

For professionals:

- Increase public education about the hazards to children regarding prescription and over-the-counter medications.

For child fatality review panels:

- Promote public education about the hazards to children regarding prescription and over-the-counter medications.

UNINTENTIONAL FIREARM FATALITIES

In 2010, two Missouri children died of unintentional firearm injuries.

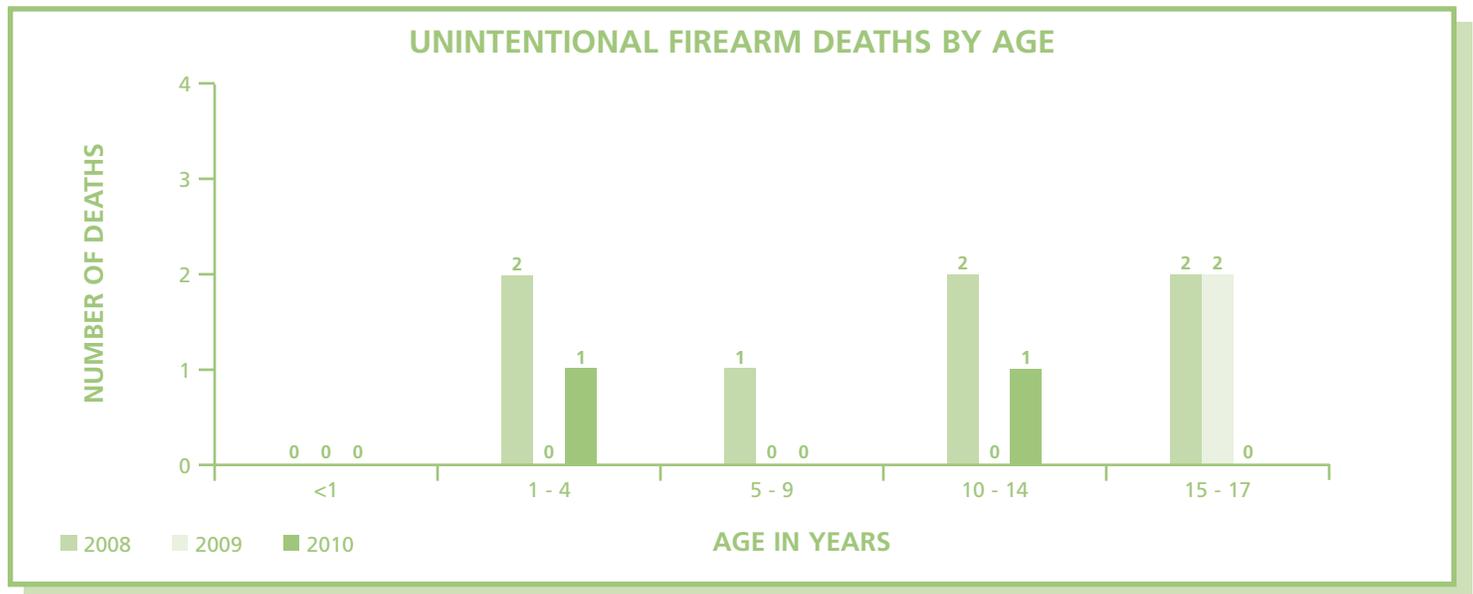

Representative Cases:

- Guns should be stored unloaded and locked.

Mother's paramour had recently moved out. Unknown to mother, he had left a loaded handgun behind. A three-year-old child found the gun and shot himself.

Three young teens had been playing basketball together at one of the boy's homes. When going inside, they found a shotgun propped in the corner of the garage. Unaware it was loaded, one of the boys picked up the gun, playfully pointed it at the 13-year-old victim and pulled the trigger.

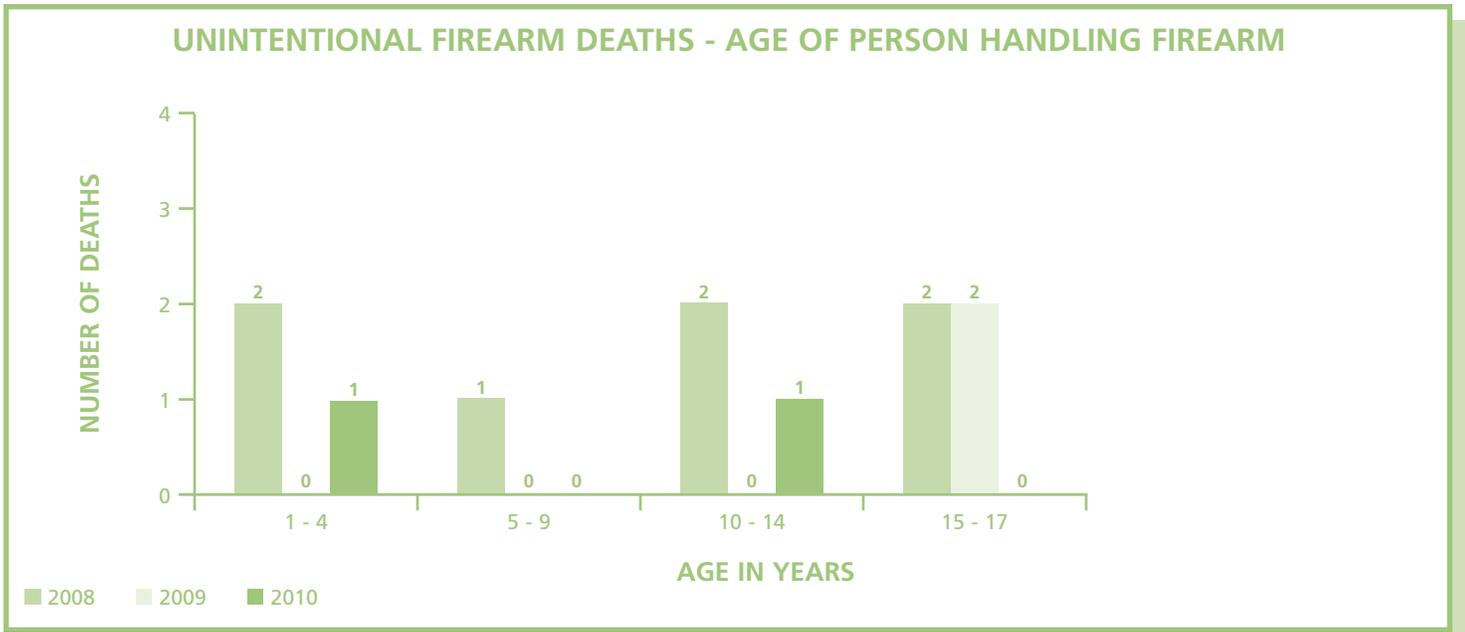

According to the CDC, 112 children died and another 2,130 children were injured through the accidental discharge of firearms in 2007. In 2010, **two** Missouri children died of unintentional firearm injuries.

In the United States, males are far more likely to be injured and die from unintentional shootings than females. Of children 17 and under who were killed by unintentional shootings, 88% were males. In Missouri, in 2010, both of the victims of unintentional shootings were male.

Nationally, more than 70% of unintentional firearm shootings involve handguns. In 2010, **one** of the **two** unintentional firearm deaths among children involved a handgun, the other death involved a shotgun.

In 2004, it was estimated that there are firearms in 40% of the U.S. households with children under 18, and in 30% of these households, the firearms were stored unlocked and loaded. Of the **two** unintentional firearm deaths reviewed by CFRP panels in 2010, both of the weapons were owned by an acquaintance, and were stored loaded and unsecured.

Unintentional Firearm Deaths Among Children

Parents need to store their guns safely and supervise their children's activities.

- Most unintentional childhood firearm deaths involve guns kept in the home that have been left loaded and accessible to children and occur when children play with loaded guns. Both of the two Missouri children, who died of a result of unintentional firearm injuries in 2010, were reported to be playing with the gun.
- Unintentional shootings among children most often occur when children are unsupervised and out of school.

Many parents have unrealistic expectations of their children's capabilities and behavior around guns:

- Nearly two-thirds of parents with school-age children, who keep a gun in the home, believe that the firearm is safe from their children. However, one study found that when a gun was in the home, 75 to 80 percent of first and second grade students knew where the gun was kept.
- Before age eight, few children can reliably distinguish between real and toy guns or fully understand the consequences of their actions. A recent study found that half of boys, ages eight to 12, who found a real handgun, were unsure whether or not it was a toy.
- Children as young as three-years old are strong enough to pull the trigger of many of the handguns available in the United States.
- In a recent study, more than 90 percent of children who found and handled a gun, or pulled the trigger, reported having some previous type of firearm safety instruction.
- Missouri has seen a 60% decline in unintentional firearm deaths over the past 10 years and similar declines have been seen nationwide. These changes can be attributed to many different factors.
- It is estimated that safety devices such as gun locks and load indicators, prevent more than 30 percent of all unintentional firearm deaths.

- To distinguish toy guns from real guns, toy guns must conform to marking requirements under the U.S. Department of Commerce Marking of Toy Look-Alike and Imitation Firearms regulation.

Prevention Recommendations:

For Parents:

- Parents who own guns should always store firearms unloaded and locked up, with ammunition locked in a separate location, out of children’s reach, use gun locks, load indicators and other safety devices on all firearms.
- All parents should teach children never to touch a gun and tell an adult, if they find one.

For community leaders and policy makers:

- Enact laws outlining owner liability for harm to others, caused by firearms.
- Enact and enforce laws requiring that new handguns be designed to minimize the likelihood of discharge by children.
- Enforce laws and ordinances that restrict access to and decrease availability of guns.

For professionals:

- Implement gun safety education. It is important to include public education about the hazards of firearms, as one component of an overall effort to reduce the incidence of firearm injuries and deaths.

For Child Fatality Review Panels:

- In all cases of firearm fatalities involving children, ensure that every effort is made to determine the source of the gun and consider the responsibility of the gun owner in the incident.

HOMICIDES

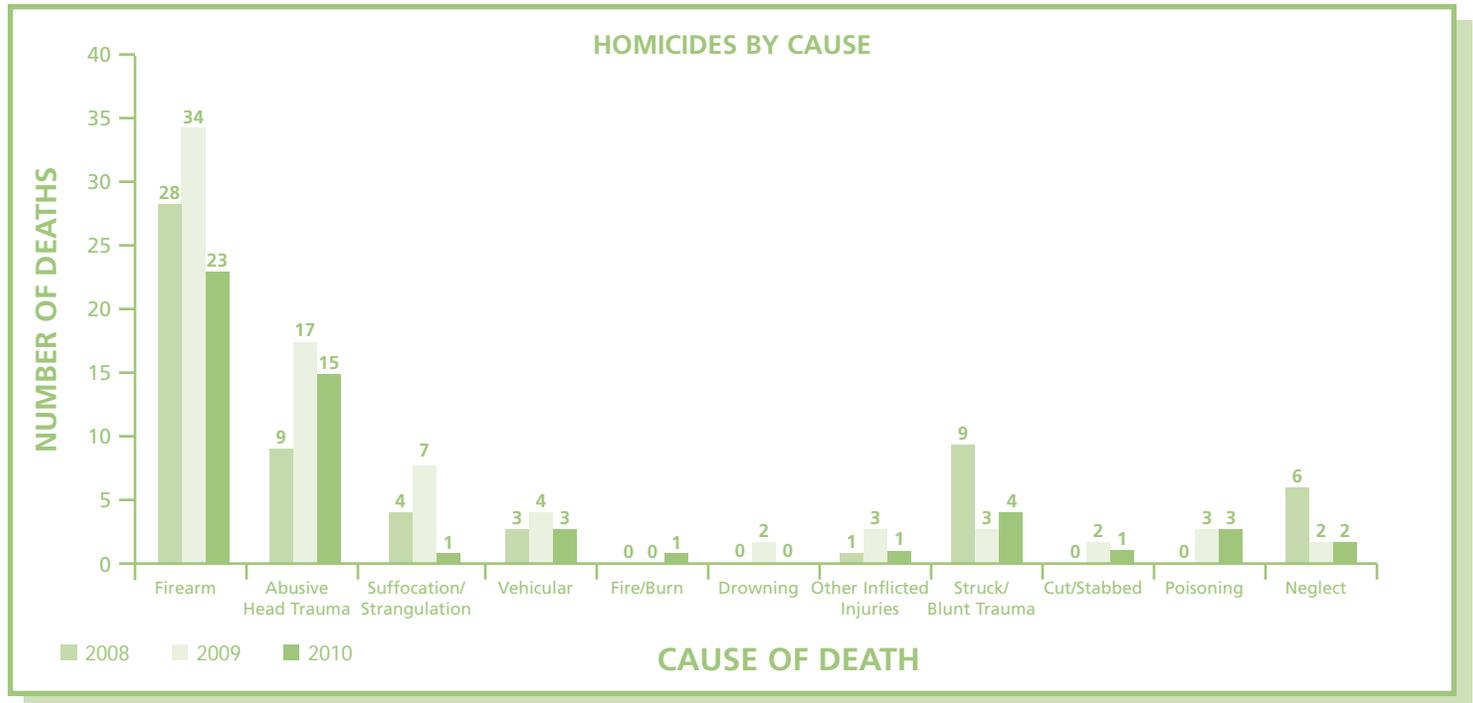

In 2010, homicide was listed as the death certificate manner of death for 54 Missouri children.

- Fatal Child Abuse and Neglect:** Child death resulting directly from inflicted physical injury and/or grossly negligent treatment by a parent or caretaker, regardless of motive or intent. This includes, but is not limited to, children whose deaths were reported as homicide by death certificate. In 2010, a total of 86 Missouri children were identified by CFRP panels, as victims of Fatal Child Abuse and/or Neglect; of those, 27 were reported by death certificate as Homicide.
- Death of a child in which perpetrator was not in charge of the child.** This most often includes youth homicides, such as gang-related or drug-related shootings and child abductions that culminates in murder. There were 17 such fatalities among Missouri children in 2010. Of those, CFRP panels identified three child deaths in which parental negligence was a contributing factor.
- Deaths of children in which the perpetrator, not in charge of the child, was engaged in criminal or negligent behavior and the child was not an intended victim.** Examples often involve firearms or motor vehicles and drugs or alcohol. In 2010, there were 10 such deaths of this type among Missouri children. Of those, CFRP panels identified four child deaths in which parental negligence was a contributing factor.

FATAL CHILD ABUSE AND NEGLECT

In 2010, 86 Missouri children were victims of Fatal Child Abuse and Neglect. Of those, 27 were reported as homicide by Death Certificate.

Representative Cases:

- Young children are more likely to die from abuse and neglect.

A seven-month old died from a complex skull fracture. He had been shaken, struck multiple times with an unknown object and kneed by the father who had been watching child and confessed to the assault.

During visitation with his father, a two-year-old child was beaten with some type of blunt object, causing fatal head trauma. The father had prior mental health, substance abuse and domestic violence issues.

- Parents and caregivers need to be educated on ways to cope with crying children.

A one-year-old child was brought into the ER with a decreased level of consciousness, multiple bruises about his head, chest and abdomen. The father was caring for the child, as mom is in jail for robbery. The father, who had been drinking and taking Xanax, stated he felt frustrated, because the child was crying.

A mother reported finding her child not breathing and without a pulse. She later admitted holding a pillow over the infant's face until he stopped breathing, to stop him from crying. The child had just been returned to the parents the day before, following unsubstantiated allegations of abuse.

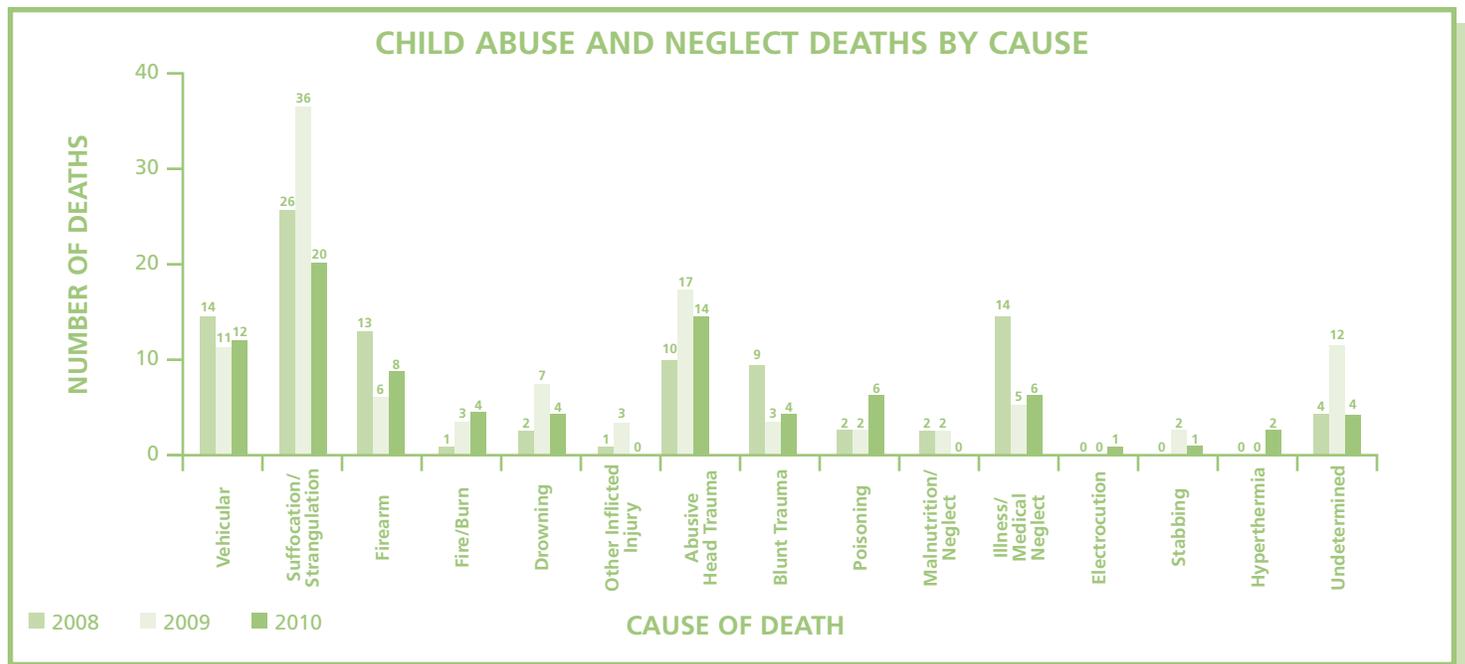

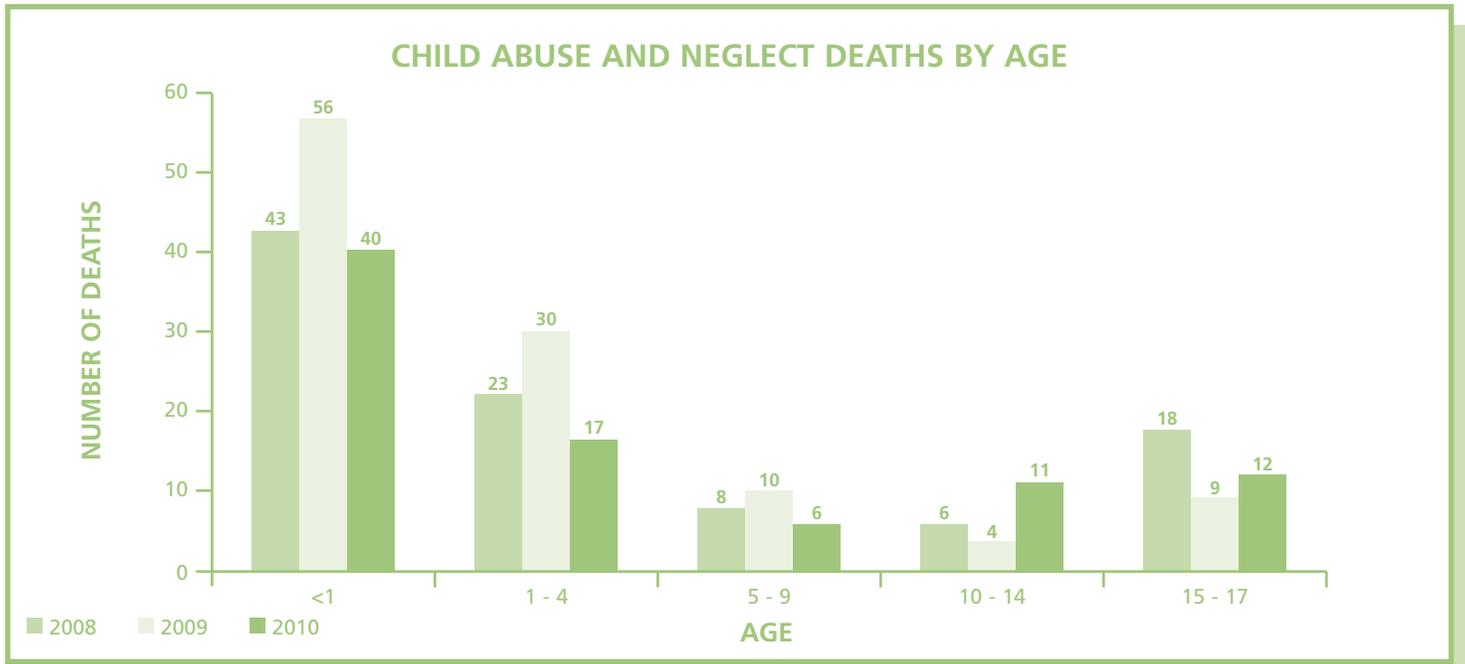

- Divorce is a time of high stress and too often it is the children who pay the price.

Going through a divorce, the father did not want the child living with the mom or grandparents. He shot the twelve-year-old child in the head, then went out to his truck and killed himself.

In the process of divorcing after a two-year history of domestic violence, both parents filed ex parte orders of protection, but the father filed first, so he got custody of six-year-old son. The child and father were later found dead from gunshot wounds.

Child fatalities are the most tragic consequences of child abuse and neglect. The National Child Abuse and Neglect Data System (NCANDS) reported an estimated 1,560 child fatalities in 2010. However, it is well documented that child abuse and neglect fatalities are under-reported and that, nationally, the numbers may be much higher. There are a number of reasons for this discrepancy and some of the fundamental problems are highlighted in this section. The Centers for Disease Control has funded an effort to develop a standardized national surveillance system capable of accurately reporting child abuse and neglect fatalities. On a state level, properly organized and functioning child fatality review systems have improved the accuracy of child death reporting.

In Missouri, there are three entities within state government responsible for child fatality information:

the Department of Health and Senior Services' Bureau of Vital Statistics, the Department of Social Services, Children's Division and the Child Fatality Review Program. All three exchange and match child fatality data in order to ensure accuracy throughout the system. However, the Bureau of Vital Statistics, Children's Division and the Child Fatality Review Program serve very different functions and, therefore, different classifications and timing periods apply, when child fatality data is reported.

Vital Statistics and Death Certificate Information

The death certificate is issued for two major purposes. One is to serve as legal documentation that a specific individual has died. In general, the death certificate serves as legal proof that the death has occurred, but not as legal proof of the cause of death. The second major purpose of the death certificate is to provide information for mortality statistics that may be used to assess the nation's health, causes of morbidity and mortality, and developing priorities for funding and programs that involve public health and safety issues.

Death certificate information is widely recognized as inadequate as a single source for identification of child abuse and neglect deaths. Misidentification of deaths may occur, because of inadequate scene investigation or autopsy procedure, inadequate investigation by law enforcement or child protection, or misdiagnosis by a physician or coroner. Child abuse and neglect fatalities often mimic illness and accidents. Neglect deaths are particularly difficult to identify, because negligent treatment often results in illness and infection that can be attributed to natural causes.

Children's Division: Child Abuse/Neglect Fatalities

The Missouri Department of Social Services, Children's Division is the hub of the child protection community. Children's Division provides a unique multi-response system for responding to each report of child abuse and neglect received by the Child Abuse/Neglect Hotline Unit (CANHU). Children's Division's responsibilities are limited to those reports that meet the legal definition of child abuse and neglect, stipulated in 201.110, RSMo, for children under the age of 18, for whom the perpetrator has care, custody and control.

Since August 2000, all child deaths are reported to the Children's Division Central Registry. Additionally by statute, child deaths are to be brought to the attention of the division by the coroner or medical examiner. A fatality report is taken and, when appropriate, the report is accepted for investigation of child abuse and neglect by the division. The Child Fatality Review Program is immediately notified of all fatality reports. The division is also responsible, if ordered by a judge, for protecting any other children in the household, until the investigation is complete and their safety can be assured.

After a report of child abuse or neglect has been made, investigations that return sufficient evidence supporting the report are classified as *preponderance of evidence child abuse and neglect*. When there is sufficient evidence to prove that a child who died was abused or neglected, or when this finding is court-adjudicated, that death is considered by the division to be a *preponderance of evidence child abuse and neglect fatality*. Thus, reports classified by the division as *preponderance of evidence child abuse and neglect fatalities* include deceased children whose deaths have been a direct result of the abuse or neglect. An example would be an unsupervised toddler who was run over in the driveway of her home. That death would be included as a pedestrian fatality in this CFRP Annual Report, with Inadequate Care as a contributing factor. In cases such as this, Children's Division may determine that here was a *preponderance of evidence* to believe that this child was the victim of neglect, specifically lack of supervision.

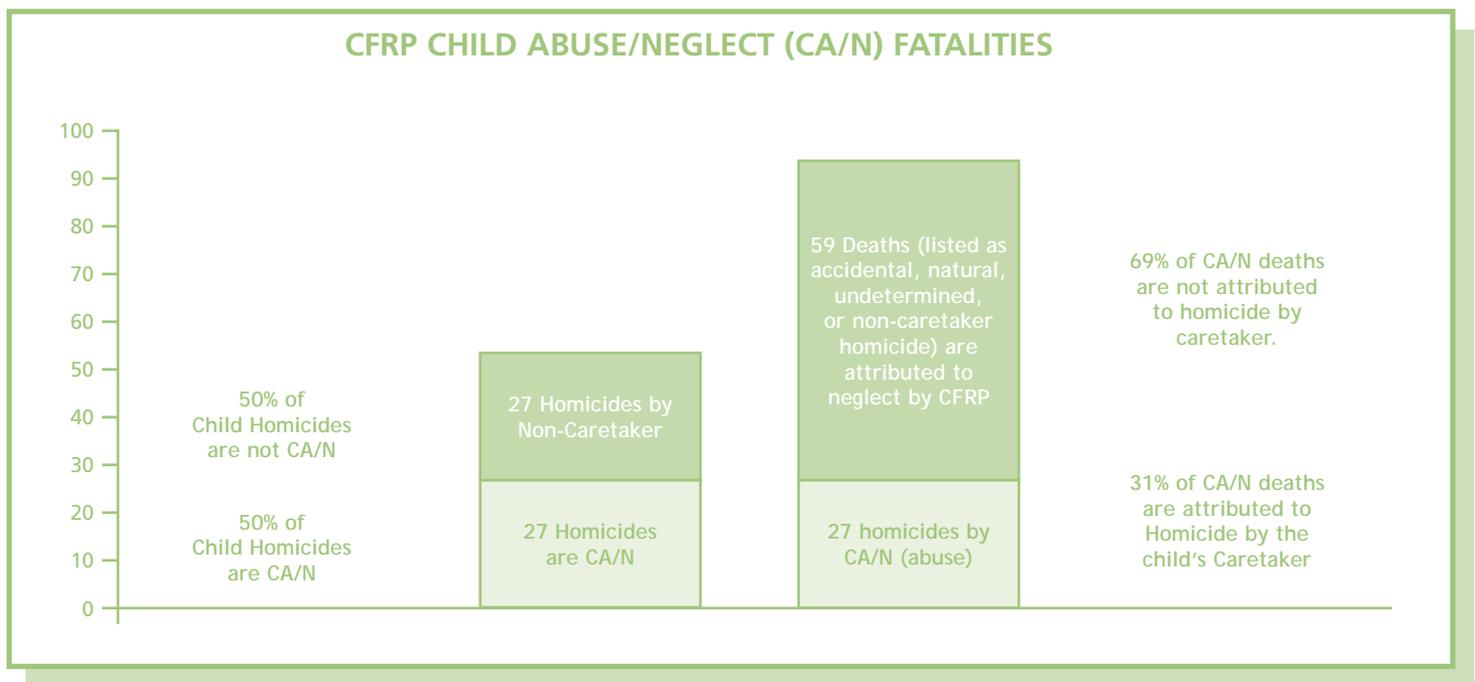

The Missouri Child Fatality Review Program: Fatal Child Abuse and Neglect

Child fatalities represent the extreme of all issues that have a negative impact on children. Despite an increasing awareness of severe violence against children, very little was known in the past about fatal child abuse and neglect. In the late 1980's, Missouri researchers discovered that many fatal child injury cases were inadequately investigated and that many children were dying from common household hazards with inadequate supervision. Many cases of fatal abuse and neglect went undetected, misclassified as natural deaths, accidents or suicides. The information necessary for a thorough investigation of a child death was distributed among agencies, which could not share records. In 1992, Missouri initiated a comprehensive, statewide child fatality review program. The CFRP review process has resulted in better investigations, more timely communication, improved training and technical assistance, and standardized data collection.

Beginning in 1999, the Child Fatality Review Program Annual Reports refined the reporting and analysis of CFRP data in many ways, including an examination of data concerning "Fatal Child Abuse and Neglect", as defined by local panels. Those numbers represented a subset of child fatalities reported as *homicide* by death certificate. These changes allowed us to begin to understand much more about how Missouri children die, the circumstances in which they die and who may be responsible.

The Child Fatality Review Program defines *Fatal Abuse and Neglect* as child deaths resulting directly from inflicted physical injury and/or grossly negligent treatment by a parent or caretaker, regardless of motive or intent. This number includes, but is no longer limited to, children whose deaths were reported as homicide by death certificate; their death certificate manners of death may include natural, accident or undetermined. See Appendices 6 and 7 for additional information.

**"Murder is no less a crime because a child, rather than an adult, is the victim."
-Unknown**

FATAL CHILD ABUSE: INFLICTED INJURY

In 2010, 27 Missouri Children died from inflicted injury at the hands of a parent or caretaker.

Fatal child abuse may involve repeated abuse over a period of time, as in battered child syndrome, or it may involve a single, impulsive incident, such as drowning, suffocation or shaken baby. Infants and younger children are more likely to die from abuse and neglect. These children are the most vulnerable for many reasons, including their dependency, small size and inability to defend themselves. In 2010, 22 of the 27 Missouri children (82%) who died from inflicted abuse or neglect at the hands of a parent or caretaker were four years of age or younger. Of those, 12 (55%) were infants under the age of one year.

In 2010, four children died of blunt trauma injuries to the abdomen or chest when they were struck, punched, kicked or thrown by a parent or caretaker. Infants and young children are especially vulnerable because vital organs are in close proximity to each other; the ribs are small and cannot protect vital internal organs. Blunt trauma to the chest and abdomen can result in massive internal injuries and bleeding.

According to Harvard Medical School, in the United States, abusive head trauma is the second most common cause of death due to trauma in children and the cause of more than 95% of serious head injuries in infants less than one year of age. In 2010, 14 Missouri children were victims of fatal Abusive Head Trauma, formerly known as Shaken Baby Syndrome (SBS).

Another common type of physical abuse among young children, but often more difficult to detect, is suffocation/strangulation. These injuries occur when hands or materials are used to block or cover external airways (suffocation) or used to exert pressure on the neck and interfere with breathing (strangulation) or pressure is exerted on the chest in order to interfere with breathing. In 2010, one Missouri children died of suffocation/strangulation injuries at the hands of a parent or caretaker.

Abusive Head Trauma

Of the 27 Missouri children who died from inflicted injury at the hand of a parent or caretaker in 2010, 14 (52%) were victims of abusive head trauma (or inflicted brain injury), formerly known as Shaken Baby Syndrome.

Abusive Head Trauma involves the violent shaking or shaking and impacting of the head of an infant or young child, usually under the age of four years. Signs and symptoms range from minor (irritability, lethargy, tremors, vomiting) to major, (seizures, coma, stupor, death), which are caused by neurological changes due to destruction of brain cells secondary to trauma, lack of oxygen to the brain cells, and swelling of the brain. Extensive retinal hemorrhages in one or both eyes are found in the vast majority of these cases. (National Center for Shaken Baby Syndrome)

Abusive Head Trauma is so lethal that approximately 25 percent of all victims die as a result of their injuries. Those that do survive may have significant neurological injury resulting in a range of impairments seen over the course of their lives, including cognitive deficits and behavioral problems. Recent Canadian data on children hospitalized for abusive head trauma show that 19% died, 59% had neurological, visual impairment and/or other health effects and only 22% appeared well at discharge. Recent data also indicate that babies who appear well at discharge may show evidence of cognitive or behavioral difficulties later on, possibly by school age.

The average age of victims is between three and eight months, although these injuries are occasionally seen in children up to four years old. Infants are particularly vulnerable to abusive head trauma injuries because of their unique physical and behaviors characterizes. Physically, infants' heads are large and heavy in proportion to their body weight and their neck muscles are too weak to support such a disproportionately large head. Also, because infants' brains are immature, they are more easily injured. During abusive head trauma, the head rotates wildly on the axis of the neck creating multiple forces within the head.

ABUSIVE HEAD TRAUMA FATALITIES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	3	7	9	WHITE	7	10	8
MALE	6	10	5	BLACK	1	6	4
				OTHER	1	1	2
	9	17	14		9	17	14

Young parents, unstable family conditions, low socioeconomic status and disability or prematurity of the child make an infant particularly vulnerable. The triggering event for the abusive head trauma is almost always the baby's crying and loss of control by the caregiver. Research has found that the amount of crying infants do tends to increase on a daily basis, starting at about one-two weeks, getting worse for up to two-three months and then starts to get better. While some babies cry more than others, all infants go through this same pattern. This is known as the "period of **PURPLE** crying," it **P**eaks, is often **U**nexpected, **R**esists soothing, the child looks like they are in **P**ain, is **L**ong lasting with an average of 35-40 minutes at a time, but can last up to two hours and it tends to happen more in the late afternoon or **E**vening. Of the **14** children who died of abusive head trauma, crying is listed as the triggering event in **three** deaths (NOTE: **Ten** of these deaths had "unknown" listed under triggering event, possibly due to the lack of cooperation from the perpetrator, and **one** listed "disobedience".)

National research has established that 60-70% of perpetrators of abusive head trauma are male. Birth fathers account for the majority, followed by mothers, and mother's boyfriends. In 2010, perpetrators of abusive head trauma fatalities in Missouri included **ten** birth fathers, **three** birth mothers and **one** mother's boyfriend.

FATAL CHILD NEGLECT: INADEQUATE CARE AND GROSSLY NEGLIGENT TREATMENT

The majority of unintentional fatalities and serious injuries among young children are the result of a temporary lack of supervision or inattention at a critical moment. This is often the case when infants and toddlers drown in bathtubs and swimming pools, or young children dart in front of moving vehicles. Parents and other caretakers often underestimate the degree of supervision required by young children. This is complicated by the mistaken idea that young children have some sort of innate fear of dangerous situations.

Negligent treatment of a child is an act of omission, which is often fatal when due to grossly inadequate physical protection, withholding nutrition or health care necessary to preserve life. Child deaths resulting from grossly negligent treatment are frequently difficult to identify, because neglect often results in illnesses and infections that can be attributed to natural causes, or exposure to hostile environments or circumstances that result in fatal “accidents.”

Definitions of negligent treatment vary depending on whether one takes a legal, medical, psychological, social services or lay perspective. There are broad, widely recognized categories of neglect that include: *physical neglect, emotional neglect, medical neglect, neglect of mental health, and educational neglect*. Within those definitions, there are subsets, as well as variations in severity that often include *severe or nearly-fatal and fatal*. Negligent treatment may or may not be intentional; however, the end result for the child is the same whether the parent is willingly neglectful (e.g., out of hostility) or neglectful due to factors such as ignorance, depression or overwhelming stress and inadequate support.

Grossly negligent treatment by a parent or caretaker generally involves failure to protect from harm and withholding or otherwise failing to provide food, shelter, or medical care necessary to meet the child’s basic needs. This level of negligence is egregious and surpasses momentary inattention or a temporary condition; it is often part of a pattern of negligent treatment. Child deaths often result when a parent or caretaker fails to adequately supervise the child, usually for extended periods of time.

In some cases, failure to protect from harm or failure to meet basic needs, involves exposure to a hostile environment or hazardous situation with potential for serious injury or death. An example would be a three-year old who was riding unrestrained, while his intoxicated parents were “playing chicken” with another vehicle. The child was ejected in the crash and died instantly. Another example is a toddler, put outside to play alone, who wandered out of the yard and drowned in a pond.

Medical neglect, as a form of grossly negligent treatment, refers to failure to provide prescribed medical treatment or emergency medical care for a known illness or injury with potential for a serious or fatal outcome; examples include untreated diabetes or asthma.

As part of the review process, CFRP panels are asked to consider and designate all child fatalities in which Inadequate Care and/or Grossly Negligent Treatment had contributed to the death of the child. In 2010, CFRP panels found that Grossly Negligent Treatment had contributed to the deaths of **86** Missouri children; of those **34** were designated as Homicide by death certificate. For data purposes, all 86 deaths are included in the appropriate data section, Natural Causes, Unintentional Injury, Homicide or Suicide.

Total Child Deaths	Cause of Death	*Circumstances of Gross Negligent Treatment that Contributed to the Death						Examples
		Lack of Supervision	Medical Neglect	Malnutrition	Exposure to Hostile Environment or Hazardous Situation	Unrestrained Child	Other	
6	Natural Cause	2	3	1	4	0	2	Three infants were born preterm and died due to mother's drug abuse. Three children died because medical care was withheld; one of those had a history of seizures and had not seen the doctor in four years.
11	Vehicular	3	0	0	2	6	3	Three children died because they were riding with intoxicated parents. Two children died when they crossed the street unsupervised. One child died due to a crash while playing chicken on a four-wheeler. One child died because he was riding on the tailgate of a pickup truck and fell off. Four children died because they were unrestrained and the vehicle they were in was involved in a crash.
19	Suffocation	7	0	0	3	0	0	Thirteen infants died of suffocation while sleeping with a parent or other person. One child choked on a toy. Two children hung themselves who showed prior indications of suicidal tendencies. Three children died due to suffocation in an unsafe sleep environment.
4	Poison	2	1	0	1	1	0	One child died after getting a hold of an adult Fentanyl patch. Three teens died due to drug overdose, in one case the parents were recovering addicts, but did not get help for the child. One teen was in obvious distress, but the parent did not get medical help and in the last, a relative supplied alcohol which complicated the issue of the drugs he had already taken.
8	Firearm	3	0	0	7	0	4	Two children were killed by their own fathers over custody issues. Two children died from having unsupervised access to firearms. Four children died due to exposure to gang violence.
4	Drowning	4	0	0	1	0	0	One unattended infant died in a bathtub. One young child died in a river after taking off his life vest unnoticed by those in charge of him. Two teens drowned in rivers while unsupervised.
4	Fire/Burn	2	0	0	2	0	0	One child died of septic shock from untreated scalding burns. One infant was left alone in a home when it caught fire. One child died in a home that had known electrical issues, while the last child was living in a home that was being heated by portable heaters.
12	Other Inflicted	4	0	0	8	0	0	One child died of electrocution, due to lack of supervision. Eleven children died of injuries inflicted by caretakers.
2	Neglect	2	0	0	0	0	0	Two children died after getting locked in a car. These same children had been locked in the same car two weeks before.
4	Undetermined	0	0	0	1	0	3	Three infants died of undetermined circumstances while co-sleeping with an adult. Another infant died soon after birth, due to maternal drug use.
Total Child Deaths = 74*		29	4	1	29	7	12	

*In some cases, more than one neglect category was applied to a single child death.

Investigation and Prosecution of Physical Child Abuse and Homicide

Most serious child abuse occurs in the privacy of the home, and seldom in the view of family or other witnesses. If evidence does exist, it is often concealed or destroyed. Perpetrators rarely fit the image of a criminal, and most jurors and judges find it hard to accept that any parent or caretaker would intentionally harm a child. There may be no outward signs of trauma, as in most cases of abusive head trauma. Cases of physical child abuse and homicide are complex and technical; proof hinges on the expertise with which the investigation is conducted, and the clarity with which details of the medical evidence are presented to the jury. The legal and medical issues are often daunting, but there are resources designed to assist criminal investigators and prosecutors in identifying perpetrators and holding them accountable.

The State Technical Assistance Team (STAT), a commissioned law enforcement unit with the Department of Social Services, is available 24-hours a day to respond to requests for assistance in the complex and highly technical field of child abuse, neglect and exploitation. Besides managing the Child Fatality Review Program, STAT also provides hands-on assistance, training and expertise, 1-800-487-1626, website: www.dss.mo.gov/stat.

National Center for Prosecution of Child Abuse, a program of the National District Attorneys Association. http://www.ndaa.org/ncpca_home.html
Provides training and technical assistance. A clearinghouse of child abuse case law, statutory initiatives, court reforms, information on expert witnesses, and trial strategies and research.

National Center on Shaken Baby Syndrome <http://www.dontshake.org/>
Provides technical assistance, research, expertise to investigation professionals, including scene investigation of suspected incidents, legal professionals, and visual presentations.

SOMETHING WE CAN DO: PREVENTING ABUSIVE HEAD TRAUMA

The majority of fatal inflicted injury deaths among children involve abusive head trauma, commonly known as Shaken Baby Syndrome (SBS). Research has demonstrated that prevention programs targeting all new parents and caregivers with education about the dangers of shaking and ways to cope with crying infants, results in a measurable reduction in the number of serious and fatal injuries.

The Children's Trust Fund (CTF), Missouri's Foundation for Child Abuse Prevention, provides SBS Prevention materials, including brochures and the newly revised, "Never Shake-Preventing Shaken Baby Syndrome" DVDs, for parents and child care providers.

For additional information, or to order education materials, contact CTF at 573-751-5147 or visit www.ctf4kids.org.

Prevention Recommendations:

For parents:

- Report child abuse and neglect.
- Seek crisis help through the Parental Stress Helpline (1-800-367-2543) or ParentLink (1-800-552-8522).

For community leaders and policy makers:

- Support and fund home-visitation child abuse prevention programs that assist parents.
- Enact and enforce laws that punish those who harm children.

For professionals:

- Support and facilitate public education programs that target male caretakers and child care providers.
- Expand training on recognition and reporting of child abuse and neglect.
- Support development and training for multidisciplinary teams to investigate child abuse.

For Child Fatality Review Panels:

- The role of the CFRP panel is critical in identifying fatal child abuse, protecting surviving children and ensuring that the family receives appropriate services. CFRP panels provide important data and enhance our ability to identify those children who are most likely to be abused and intervene before they are harmed.

OTHER HOMICIDES

Of the 54 child homicides in Missouri in 2010, 27 involved perpetrators who were not in charge of the child; of those 21 (81%) involved firearms.

Representative Cases:

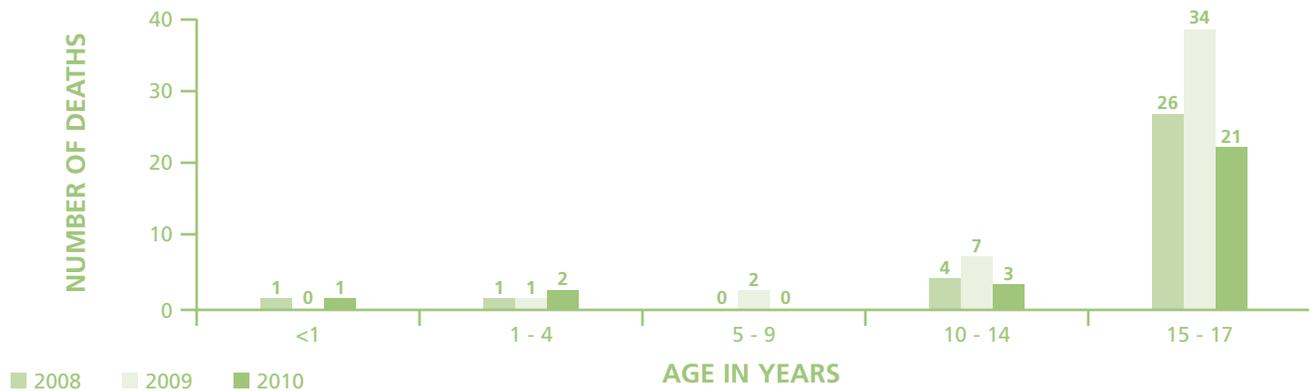

- The increased availability of guns and drugs contribute to violence.

A large group of teens was standing out in front of a club. An occupant of a vehicle became involved in a heated exchange. A youth in the vehicle had a handgun and began shooting people, striking eight or nine people in the crowd. Two seventeen-year olds died.

A seventeen-year old answered the door of his residence and was confronted by someone he knew from school. The other boy pulled out a pistol and shot the decedent two times.

A sixteen-year old and two friends were sitting in a car. A stranger walked up and opened fire with two handguns. There is no known reason for shooting. The victim was transported to the hospital and died four days later.

OTHER HOMICIDE DEATHS BY AGE

OTHER HOMICIDES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	8	10	5	WHITE	7	12	8
MALE	24	34	22	BLACK	25	32	17
				OTHER	0	0	2
	32	44	27		32	44	27

In 2010, 27 Missouri children were murdered by non-caretakers. Of those, 17 were youth homicides in which the perpetrator was another child. Most youth homicides involve juvenile crime and violence, or abductions by adults or other adolescents that culminate in murder.

Of the 27 Missouri children murdered by non-caretakers in 2010, ten involved a perpetrator who was not in charge of the child, was engaged in criminal or negligent behavior, and the child was not an intended victim.

Youth homicide

The most common mechanism of juvenile homicide is firearms. Twenty-one Missouri children died of non-child-abuse intentional firearm injuries in 2010. Youth homicides are a serious problem in large urban areas, especially among black males. The percentage of firearm homicides among Missouri adolescents has risen sharply in the last four years; particularly when drug and gang activity is a factor.

YOUTH VIOLENCE	
Firearm	16
Other Inflicted	1
HOMICIDES, OTHER	
Firearm	5
Other Inflicted	1
Fire/Burn	1
Poisoning	1
Vehicular	2

According to the Office of Juvenile Justice and Delinquency Prevention, the national juvenile arrest rate for murder more than doubled from the mid 1980's to 1993. The rate then fell until 2004, when it again increased until it began to fall again in 2008, which is the last year that national statistics are available. In Missouri on the other hand, the rate of youth violence homicides peaked in 2001, fell until 2006 and has since risen sharply to a peak in 2009 that was 27% higher than in 2001. Then, this year saw a dramatic 50% decrease in youth violence homicides in Missouri.

Research on youth violence has increased our understanding of factors that make some populations more vulnerable to victimization and perpetration. Risk factors increase the likelihood that a young person will become violent. However, risk factors are not direct causes of youth violence; instead, risk factors contribute to youth violence. For example, in Missouri in 2007, 19% of high school participants in the Youth Risk Survey indicated that they had carried a weapon during the past month.

The Surgeon General's report on youth violence associates the following risk factors with perpetration of youth violence:

Individual Risk Factors

- History of violent victimization.
- Attention deficits, hyperactivity or learning disorders.
- History of early aggressive behavior.
- Involvement with drugs, alcohol or tobacco.
- Low IQ.
- Poor behavioral control.
- Deficits in social cognitive or information-processing abilities.
- High emotional distress.
- History of treatment for emotional problems.
- Antisocial beliefs and attitudes.
- Exposure to violence and conflict in the family.

Family Risk Factors

- Authoritarian childrearing attitudes.
- Harsh, lax or inconsistent disciplinary practices.
- Low parental involvement.
- Low emotional attachment to parents or caregivers.
- Low parental education and income.
- Parental substance abuse or criminality
- Poor family functioning.
- Poor monitoring and supervision of children.

Peer/School Risk Factors

- Association with delinquent peers.
- Involvement in gangs.
- Social rejection by peers.
- Lack of involvement in conventional activities.
- Poor academic performance.
- Low commitment to school and school failure.

Community Risk Factors

- Diminished economic opportunities.
- High concentrations of poor residents.
- High level of transiency.
- High level of family disruption.
- Low levels of community participation.
- Socially disorganized neighborhoods.

Protective factors buffer young people from the risks of becoming violent. These factors exist at various levels. To date, protective factors have not been studied as extensively or rigorously as risk factors; however, identifying and understanding protective factors are equally as important as researching risk factors.

Individual Protective Factors

- Intolerant attitude toward deviance.
- High IQ.
- High grade point average.
- Positive social orientation.
- Religiosity.
- Connectedness to family or adults outside the family.
- Ability to discuss problems with parents.
- Perceived parental expectations about school performance are high.
- Frequent shared activities with parents.
- Consistent presence of parent during at least one of the following: when awakening, when arriving home from school, at evening mealtime or going to bed.
- Involvement in social activities.

Peer/School Protective Factors

- Commitment to school.
- Involvement in social activities.

Violence Prevention Recommendations:

For parents:

- Provides supervision, support and constructive activity for children and adolescents in your household.
- Access family therapy and parenting assistance, as necessary, for help with anger management skills, self-esteem and school problems.

For community leaders and policy makers:

- Support the implementation of violence prevention initiatives.
- Encourage programs that provide support, education and activities for youth.
- Support legislation that restricts access to guns by children and adolescents.

For professionals:

- Support and implement crisis interventions and conflict resolution programs within the schools.

For child fatality review panels:

- Ensure that support for victims and survivors of youth violence is available.
- Support proactive approaches to crime control, especially those programs that include efforts to confiscate illegally carried firearms.

SUICIDE

In 2010, 21 Missouri children committed suicide

“Suicide is not chosen; it happens when pain exceeds resources for coping with pain.”
- D. L. Conway

Representative Cases:

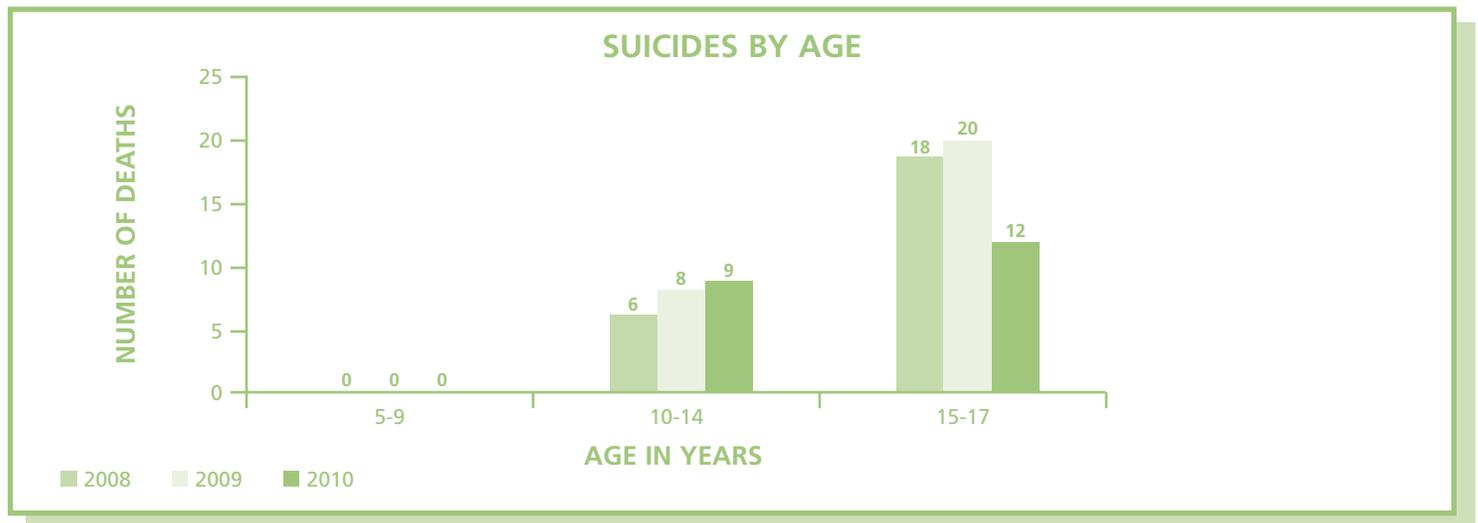

- Parents and professionals that are responsible for children must be educated to recognize and respond to risk factors for suicide.

A seventeen-year-old child had previous drug and alcohol abuse issues, as well as suicide threats and idealizations. He was able to pull the door of a locked gun cabinet open far enough to reach in and retrieve a pistol that was stored in the bottom of the cabinet. He went outside while his mother was in the shower and shot himself in the head.

A sixteen-year old was suspended from high school for anger management issues. He wanted to go out with friends, his mother refused to allow him to. He went to the basement and was later found by his step-brother hanging by the washing machine.

A fourteen-year-old girl with a history of Attention Deficit Disorder, bipolar disorder and self mutilation was found unresponsive in the early morning by her mother. She had previously attempted suicide by overdose and was on Abilify and Celexa. Toxicology found that she had died from an overdose of oxycodone.

According to Missouri Department of Mental Health, suicide rates for older adolescents and young adult males, ages 15-24, have decreased since peaking in the early 1990s. By contrast, the rate for adolescent males, ages 10-14, while relatively low, increased slightly from 1.2 in 1981, to 1.7 in 2003. Rates for all females, ages 10-24, decreased during the same period. In 2010, 21 children died of self-inflicted injuries; twelve were ages 15-17; the remaining nine were children ages 10-14.

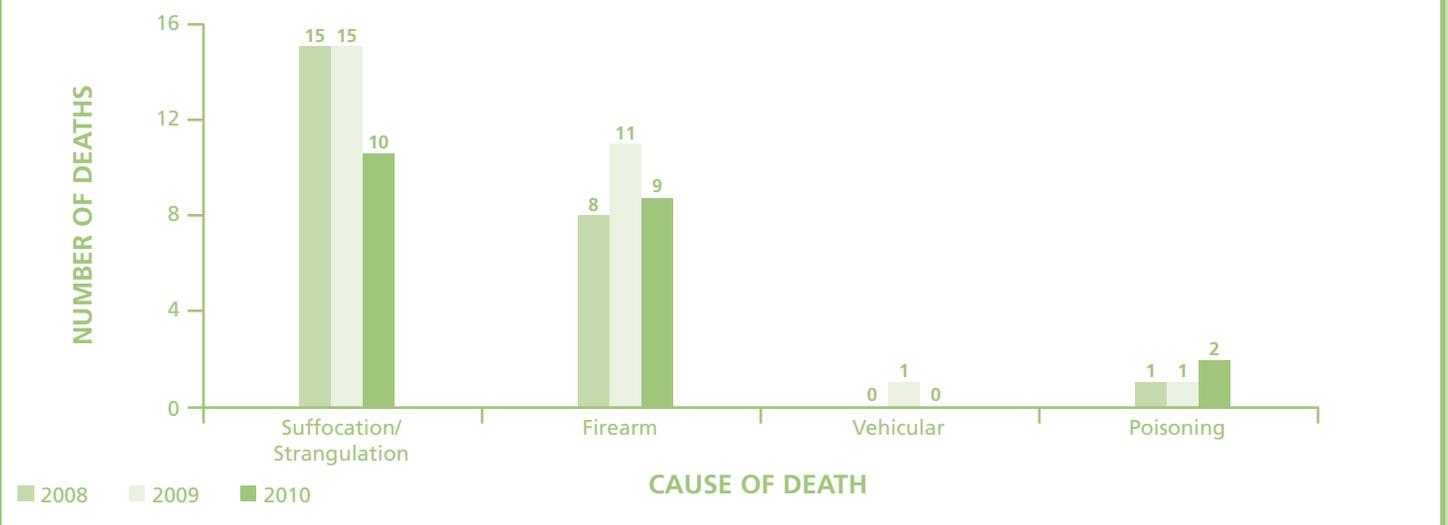

White males comprise the majority of adolescent suicide victims in Missouri. Although more females attempt suicide than males, males are approximately three times more likely to die from suicide.

SUICIDES BY SEX AND RACE

SEX	2008	2009	2010	RACE	2008	2009	2010
FEMALE	4	9	7	WHITE	22	27	20
MALE	20	19	14	BLACK	2	1	1
	24	28	21		24	28	21

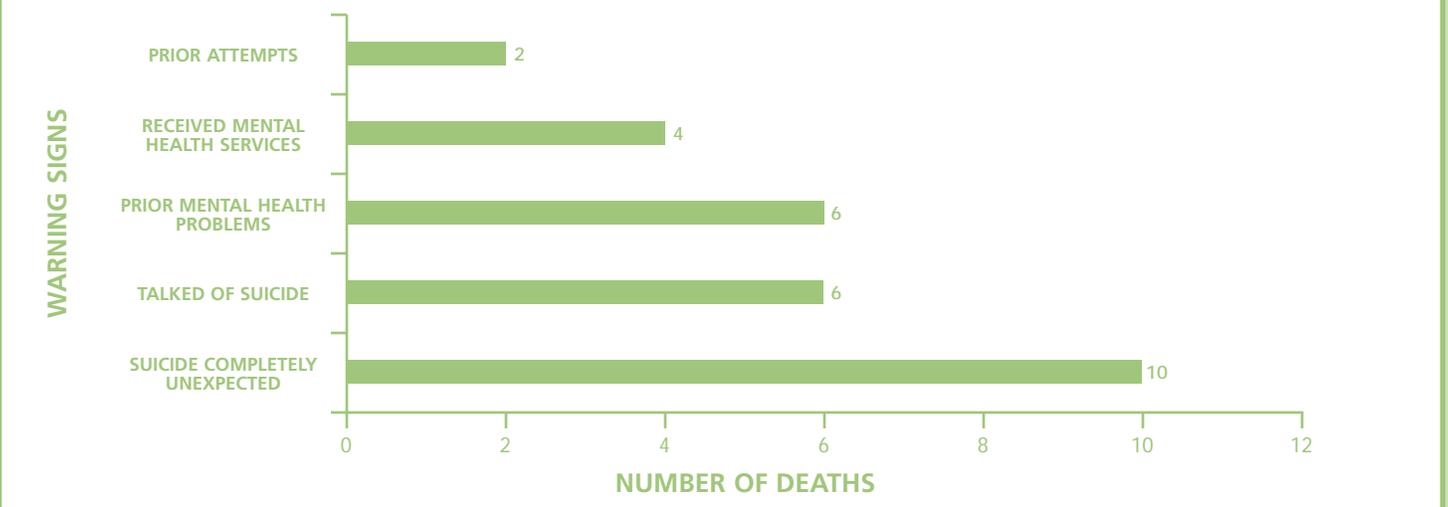

Suffocation/strangulation and firearms are the most common mechanism of suicide among Missouri children.

SUICIDES BY MECHANISM

Suicide is rarely a spontaneous decision and most people give warning signs that they are contemplating taking their own lives. Of the 21 Missouri children who committed suicide in 2010, ten had displayed one or more warning signs.

WARNING SIGNS OF SUICIDE

“The suffering of the suicidal is private and inexpressible, leaving family members, friends, and colleagues to deal with an almost unfathomable kind of loss, as well as guilt. Suicide carries in its aftermath a level of confusion of devastation that is, for the most part, beyond description.”

-Kay Redfield Jamison

Risk and Protective Factors For Youth Suicide:

Suicide is a reaction to intense feelings of loneliness, worthlessness, hopelessness, or depression. Suicidal behaviors in young people are usually the result of a process that involves multiple social, economic, familial and individual risk factors with mental health problems playing an important part in its development. The Missouri Suicide Prevention Plan tells us that understanding the interactive relationship between risk and protective factors in suicidal behavior continues to be studied and drives the development of interventions.

Risk factors are a combination of stressful events, situations, and/or conditions that may increase the likelihood of suicide, especially when several coincide at any given time. Risk factors for suicide include, but are not limited to:

Biopsychosocial Risk Factors

- Mental disorders, particularly mood disorders, schizophrenia, anxiety disorders and certain personality disorders.
- Alcohol and other substance use disorders.
- Hopelessness.
- Impulsive and/or aggressive tendencies.
- History of trauma or abuse (bullying, violence and assault).
- Some major physical illnesses.
- Previous suicide attempt.
- Family history of suicide.

Environmental Risk Factors

- Academic, job or financial loss.
- Relational or social loss (divorce, incarceration, legal problems).
- Easy access to lethal means.
- Local clusters of suicide that have a contagious influence.

Sociocultural Risk Factors

- Lack of social support and sense of isolation.
- Stigma associated with help-seeking behavior.
- Barriers to accessing health care, especially mental health and substance abuse treatment.
- Certain cultural and religious beliefs (for instance, the belief that suicide is a noble resolution of a personal dilemma).
- Exposure to suicidal behavior of others, including through media coverage and influence of others who have died by suicide.

Protective factors make it less likely that individuals will develop suicidal ideations, and may encompass biological, psychological or social factors in the individual, family and environment.

Protective factors:

- Effective clinical care for mental, physical and substance use disorders.

- Easy access to a variety of clinical interventions and support for help-seeking.
- Restricted access to highly lethal means of suicide.
- Strong connections to family and community support.
- Support through ongoing medical and mental health care relationships.
- Skills in problem solving, conflict resolution and nonviolent handling of disputes.
- Cultural and religious beliefs that discourage suicide and support self-preservation.

The Missouri Suicide Prevention Plan:

In 1999, the U.S. Surgeon General, Dr. David Satcher, issued a Call to Action to Prevent Suicide, introducing an initial blueprint for reducing suicide in the United States, summarized as AIM - Awareness, Intervention and Methodology. In response to national recognition of suicide as a worldwide public health problem, collaborative planning efforts began in Missouri that resulted in the passage of legislation in 2003 that mandates the development of this statewide suicide prevention plan.

The Missouri Suicide Prevention Plan, 2005-2010 includes research, data-specific strategies for reducing suicide and suicidal behaviors, and links to suicide prevention resources. The state plan is available online at the Missouri Department of Mental Health website: <http://dmh.mo.gov/mentalillness/suicideplan.pdf>. The writers' point out that suicide is a huge and complex problem. Missouri's communities are too diverse in their members and needs, for a single intervention to be adequate. Thus, a diverse array of interventions will be required to meet the particular local needs of the many unique communities in Missouri. Collaboration is essential if the activities outlined in this section are to be effective.

Prevention Recommendations:

For parents:

- Seek early treatment for children with behavioral problems, possible mental disorders (particularly depression and impulse-control disorders) and substance abuse problems.
- Limit young people's access to lethal means of suicide, particularly firearms.

For community leaders and policy makers:

- Encourage health insurance plans to cover mental health and substance abuse on the level physical illnesses are covered.
- Support and implement school and community prevention programs designed to address suicide and suicidal behavior as part of a broader focus on mental health and coping skills, in response to stress, substance abuse and aggressive behaviors.
- Enact and enforce laws and policies that limit young people's access to firearms and encourages responsible firearm ownership.

For professionals:

- Children who have attempted suicide or displayed other warning signs should receive aggressive treatment attention.

For child fatality review panels:

- Support or facilitate evidence-based suicide prevention programs in your community.
- In reviewing a possible suicide, carefully consider the warning signs and history of the victim. Consider also, points of early intervention that can be enhanced in your community to prevent other suicides and suicidal behaviors.

“Suicide has stolen lives around the world and across the centuries. Meanings attributed to suicide and notions of what to do about it have varied with time and place, but suicide has continued to exact a relentless toll. Only recently have the knowledge and tools become available to approach suicide as a preventable problem with realistic opportunities to save many lives.”

-National Strategy for Suicide Prevention

THE PRACTICAL APPLICATION OF CHILD DEATH REVIEW: PREVENTION OF CHILD FATALITIES

The death of a child is a sentinel event that captures the attention of the public and creates a sense of urgency that deserves a well-planned and coordinated prevention response. Generally successful prevention initiatives are realistic in scope and approach, clear and simple in their message, and based on evidence that they work.

Local and regional teams are remarkably dedicated and enthusiastic in initiating timely prevention activities that serve to raise awareness, educate parents and caretakers, influence public policy and involve the community in prevention initiatives. In Missouri, local child fatality review panel members organized a coalition focused on child fatality prevention after two residential fires killed three children in less than a month. The coalition collaborated with two area fire departments to canvas the neighborhoods where the deaths occurred, installed smoke detectors and batteries where they were needed and raised public awareness through the media. Over a decade later, the Annual Neighborhood Fire Prevention Awareness day continues in multiple locations throughout the state.

At the state and national level, the sum of collected data is used to identify trends and patterns that require systemic solutions. Researchers in St. Louis utilized Missouri child fatality review data to gain new insights into sudden unexpected infant deaths and concluded that certain unsafe sleep arrangements occurred in the large majority of cases of sudden unexpected infant deaths diagnosed as SIDS, unintentional suffocation and cause undetermined. Research demonstrated what child fatality review panel members had suspected: infant deaths caused by unsafe sleep conditions were preventable. In Missouri, Pennsylvania, Michigan, Wisconsin and other states, safe sleep campaigns, developed and implemented by a variety of public and private entities, include parent education and provision of a safe crib to families in need. The Consumer Product Safety Commission and the American Academy of Pediatrics revised their safe sleep recommendations to reflect this new information.

Basic Principles

It is widely accepted among professionals in the field of injury prevention that the public health tools and methods used effectively against infectious and other diseases and occupational hazards can also be applied to injury prevention. As a result, attention is given to the environment and to products used by the public, as well as individual behavior. An epidemiologic approach to child fatalities and near-fatalities offers tools that can effectively organize prevention interventions and draws on expertise in surveillance, data analysis, research, public education and intervention. There are four steps that are interrelated:

- **An ongoing surveillance of child fatalities provides comparable data, documentation and monitoring over time. (What's the problem?)** A national level standardized case reporting tool and Internet-based data collection system is improving and protecting the lives of all children and adolescents on a national level. The collection of uniform data better gives us the opportunity to identify valuable national trends, risks, spikes and patterns. The National Center for Review & Prevention of Child Deaths (NCRPCD) provides technical assistance and training, support, resources and tools to states with the goal of expanding reviews to all preventable deaths, and using the information from CDR to improve and protect the lives of children.

- **Risk factor research identifies or confirms what is known about risk and protective factors that may have relevance for public policies and prevention programs. (What is the cause?)** In western New York, a hospital-based program was developed to educate all new parents about the dangers of shaking an infant, now known as abusive head trauma. This initiative effectively reduced the incidence of abusive head trauma in that region, since it was implemented. This program has been replicated throughout the country and proven equally successful. Several states have passed legislation requiring this program for child care providers. In this way, prevention of abusive head trauma is being integrated in state and community systems that provide services and support to children and families.
- **Identification of evidence-based strategies that have proven effective or have high potential to be effective. (What works?)** Assessing effectiveness of a prevention strategy as it is implemented is difficult, because of limited resources and limited reliability of existing assessment tools. However, resources are available to assist in evaluating various strategies during the early stages of planning. The benefits in terms of funding and long-term cost are obvious. The safe sleep initiative was based on research into sudden unexpected infant deaths. University-based research groups, such as Harborview Injury Prevention and Research Center and the Childhood Injury Research Group at the University of Missouri provide evaluations of various injury prevention strategies. National organizations and governmental agencies, such as the National SAFE KIDS Campaign and the National Center for Injury Prevention at CDC and the American Academy of Pediatrics provide research and prevention information.
- **Implementation of strategies where they currently do not exist. (How do you do it?)** Outcomes for prevention initiatives are generally functions of structure and duration. Short-term, emergency and educational programs are effective in the short term; unfortunately, such programs are usually based on the effort and enthusiasm of a few individuals and a limited funding source. Prevention initiatives that are integrated into communities as state systems are sustainable and effective in the long term. Examples include state laws that require proper restraints for child passengers in motor vehicles and helmets for children riding bicycles. In many areas, schools include safety education for children and health care providers who are in a unique position to assist in the prevention of child maltreatment, and actively promote health and safety for children. Many state and local entities responsible for licensing child care providers are mandating education on safe sleep for infants and toddlers, and prevention of child abuse, including abusive head trauma as part of their curricula.

PREVENTION FINDINGS: THE FINAL REPORT

“Injury is a problem that can be diminished considerably if adequate attention and support are directed to it. Exciting opportunities to understand and prevent injuries and to reduce their effects are at hand. The alternative is the continued loss of health and life to predictable, preventable and modifiable injuries.”

-Dr. William Foege, Former Director of the Centers for Disease Control and Prevention

The difference between a fatal and nonfatal event is often only a few feet, a few inches, or a few seconds. In the past, most people believed that serious and fatal injuries were random or unavoidable events, or simply the result of individual carelessness. Fortunately, the science of injury prevention has moved away from this fatalistic approach to one that focuses on the environment and products used by the public, as well as individual behavior. As a result, unintentional injury-related death rates among children in the United States have declined dramatically over the last two decades. Injuries are now widely recognized as understandable, predictable and preventable.

A preventable child death is defined as one in which awareness or education by an individual or the community may have changed the circumstances that lead to the death. Prior to August 2000, CFRP panels were asked to report their conclusions and prevention responses for each death reviewed on the Data Form 2. Legislation passed in 2000 now requires that the panel complete a Final Report, summarizing their findings in terms of circumstances, prevention messages and community-based prevention initiatives.

The death of a child is a sentinel event that captures the attention of the community, creates a sense of urgency and a window of opportunity to respond to the questions, “What can we do?” County-based prevention activities serve to raise awareness, educate parents and caretakers, influence the public policy and involve the community in prevention initiatives that protect and improve the lives of children. In 2010, CFRP panels throughout our state reported their findings and prevention responses utilizing the final report. The initiatives highlighted below demonstrate how a few volunteer professionals have been able to measurably reduce or eliminate threats to the lives and well being of countless Missouri children.

Educational activities in school

- In a vehicle full of teenagers that failed to stop at an intersection, a 16-year-old girl was the only one in the vehicle that was unrestrained, and the only one that died. The panel recommended that the local school implement a school awareness day on the importance of using your seatbelt.

- A 17-year old was stealing his grandfather's prescription and died of an overdose of oxycodone. The panel recommended educational activities in the school and media, as well as public forums, to discuss the dangers of improper use of prescription medication, and education on the proper way to store and dispose of medications.
- An unrestrained 13-year-old boy died when his intoxicated father swerved, hitting a tree and ejecting the child out of the vehicle. The panel recommends more education in the schools about seatbelt safety and the dangers of riding with a person under the influence of alcohol or drugs.
- A 14-year-old boy, with no reported signs of depression or suicidal tendencies, died of a self-inflicted gunshot wound to the head. The panel recommended suicide awareness prevention activities at school with information for parents and school personnel on how to spot the signs of depression in teens.
- At 14-year-old boy was hit by a car when he and his friends tried to cross a busy highway on foot. The panel recommended educational activities in the schools on pedestrian safety.

Changes in agency practices

- A 13-year-old, developmentally-delayed child died from abuse and neglect. He had been pulled out of school by his mother for home schooling, and there is no evidence of follow up by the educational system for the past four years. The panel recommends improvement in the follow up on children with disabilities removed from school for homeschooling.
- A one-week-old infant suffocated while sharing the same sleep surface with her parents. The panel discussed periodic media releases to emphasize safe sleep for babies and the county health department began handing out Back to Sleep literature to all recipients of WIC benefits.

Educational activities in media

- A vehicle crossed the centerline of the highway, swiping another vehicle. The driver then over corrected, sending the vehicle off the roadside overturning several times. The vehicle came to rest on top of the ejected 17-year-old unrestrained passenger. The panel recommended educational activities in both the schools and media on the importance of wearing seatbelts and the dangers of distracted driving.
- A two-week old child was sleeping with both parents and a sibling in a full-sized bed and was found unresponsive in the morning. The panel recommended that there be educational public service announcements in the media on the dangers of sharing the same sleep surface with an infant.

New Service

- The paramour of a 16-year-old's mom had found a gun and brought it into the home. It did not have a clip so the boy, playing with the gun, thought it was unloaded, but there was one bullet left in the chamber. The panel recommended a press release on gun safety.
- A six-month old suffocated when he became tangled in the excess blankets that were in his crib. The community had already addressed safe sleep practices through the use of pamphlets and education for new parents. The panel recommended some public service announcements on the local radio to try and get the message of safe sleep across to the public.

Community Safety Project

- A two-year-old child died from blunt force injuries. The mother's paramour was subsequently arrested. The panel recommended community outreach to address the importance of safe child care and how to manage parental stress.
- Two teenagers, ages 16 and 17, were shot and killed while trying to get into a club. An unknown gunman had gotten into an argument with someone else and began shooting into the crowd. The panel recommends the community explore the idea of appropriate venues for teens.
- A seven-year-old child died when the vehicle he was in failed to yield the right away while crossing the highway. The panel recommended slowing the speed limit through this type of intersection, adding signage and lights, which was subsequently addressed by the Department of Transportation.

Legislation, Law or Ordinance

- A four-year old drowned in a pool owned by a family member. The panel recommended that Missouri laws needed to be stricter in regards to owning a pool and ensuring proper safety measures are taken.

Other programs or activities

- A three-month-old child was sharing the same sleep surface with both parents and two siblings. He was found dead face down into the bedding in the morning. The panel recommended the education of new parents on the dangers of sleeping with their infant and the importance of putting the infant on its back alone in an appropriate crib, through the local hospitals, public health nurses and other social service agencies.

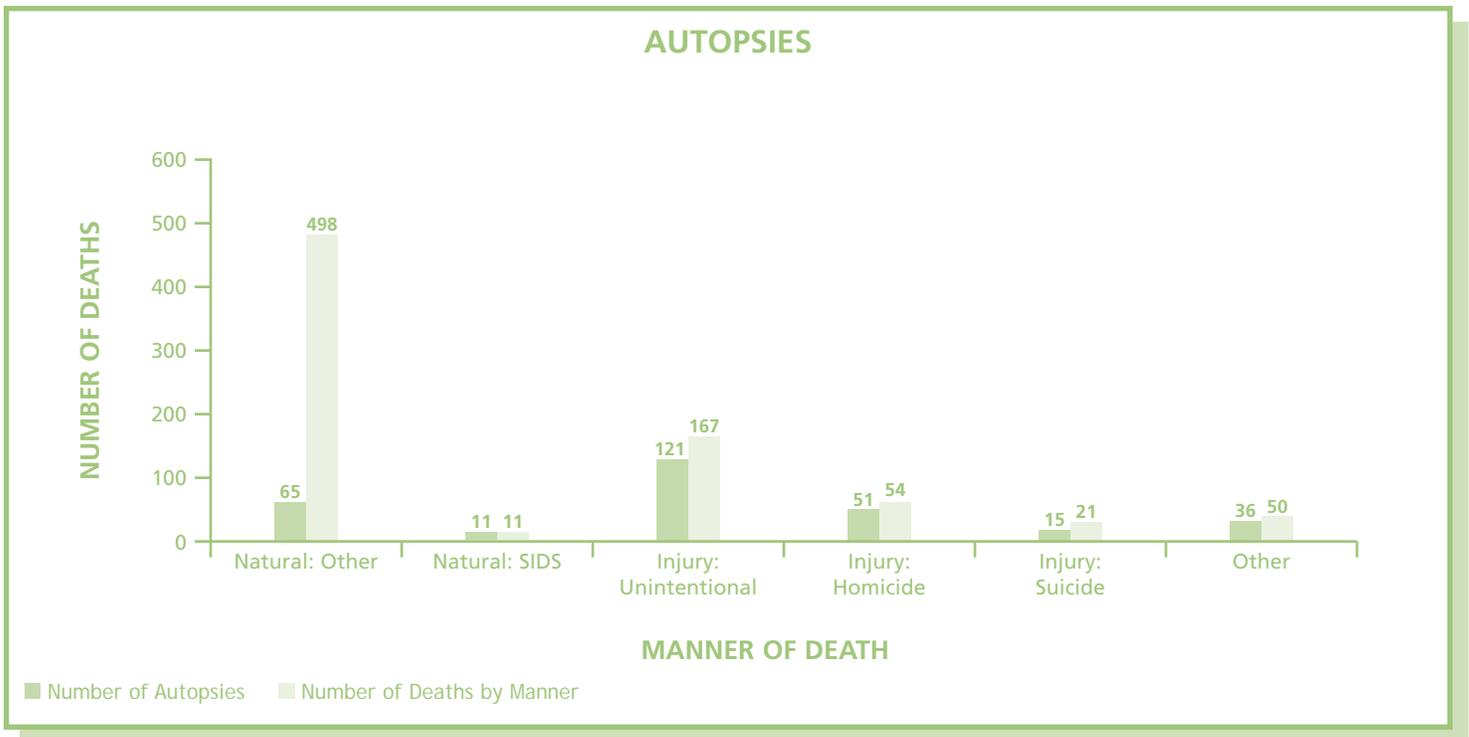

APPENDICES

APPENDIX 1. AUTOPSIES

The autopsy is a critical component in accurately determining the cause of death, especially in the case of sudden infant deaths. RSMo. 194-117 requires that an autopsy be performed for all children from one week to one year of age, who die in “suddenly when in apparent good health”.

Missouri’s Certified Child Death Pathologist Network ensures autopsies performed on children, birth through ages 17, and are performed by professionals with expertise in forensic pediatrics. Additionally, network members are available to consult with coroners and others investigating child deaths. A listing of network members can be obtained through STAT or on the internet at www.dss.mo.gov/stat/cpn.htm

APPENDIX 2. MANDATED ACTIVITIES FOR CHILD FATALITIES

Every county must have a multidisciplinary child fatality review panel (114 counties and City of St. Louis).

The county panel must consist of at least the following seven core members: prosecuting attorney, coroner/medical examiner, law enforcement representative, Children's Division representative, public health representative, juvenile officer and emergency services representative. Panels may elect to have additional optional members on either a permanent or situational basis.

All deaths, ages birth to 17, must be reported to the coroner/medical examiner.

Children, age one week to one year, who die in a sudden, unexplained manner, **must** have an autopsy.

The State CFRP panel must meet at least twice per year to review the program's progress and identify systemic needs and problems.

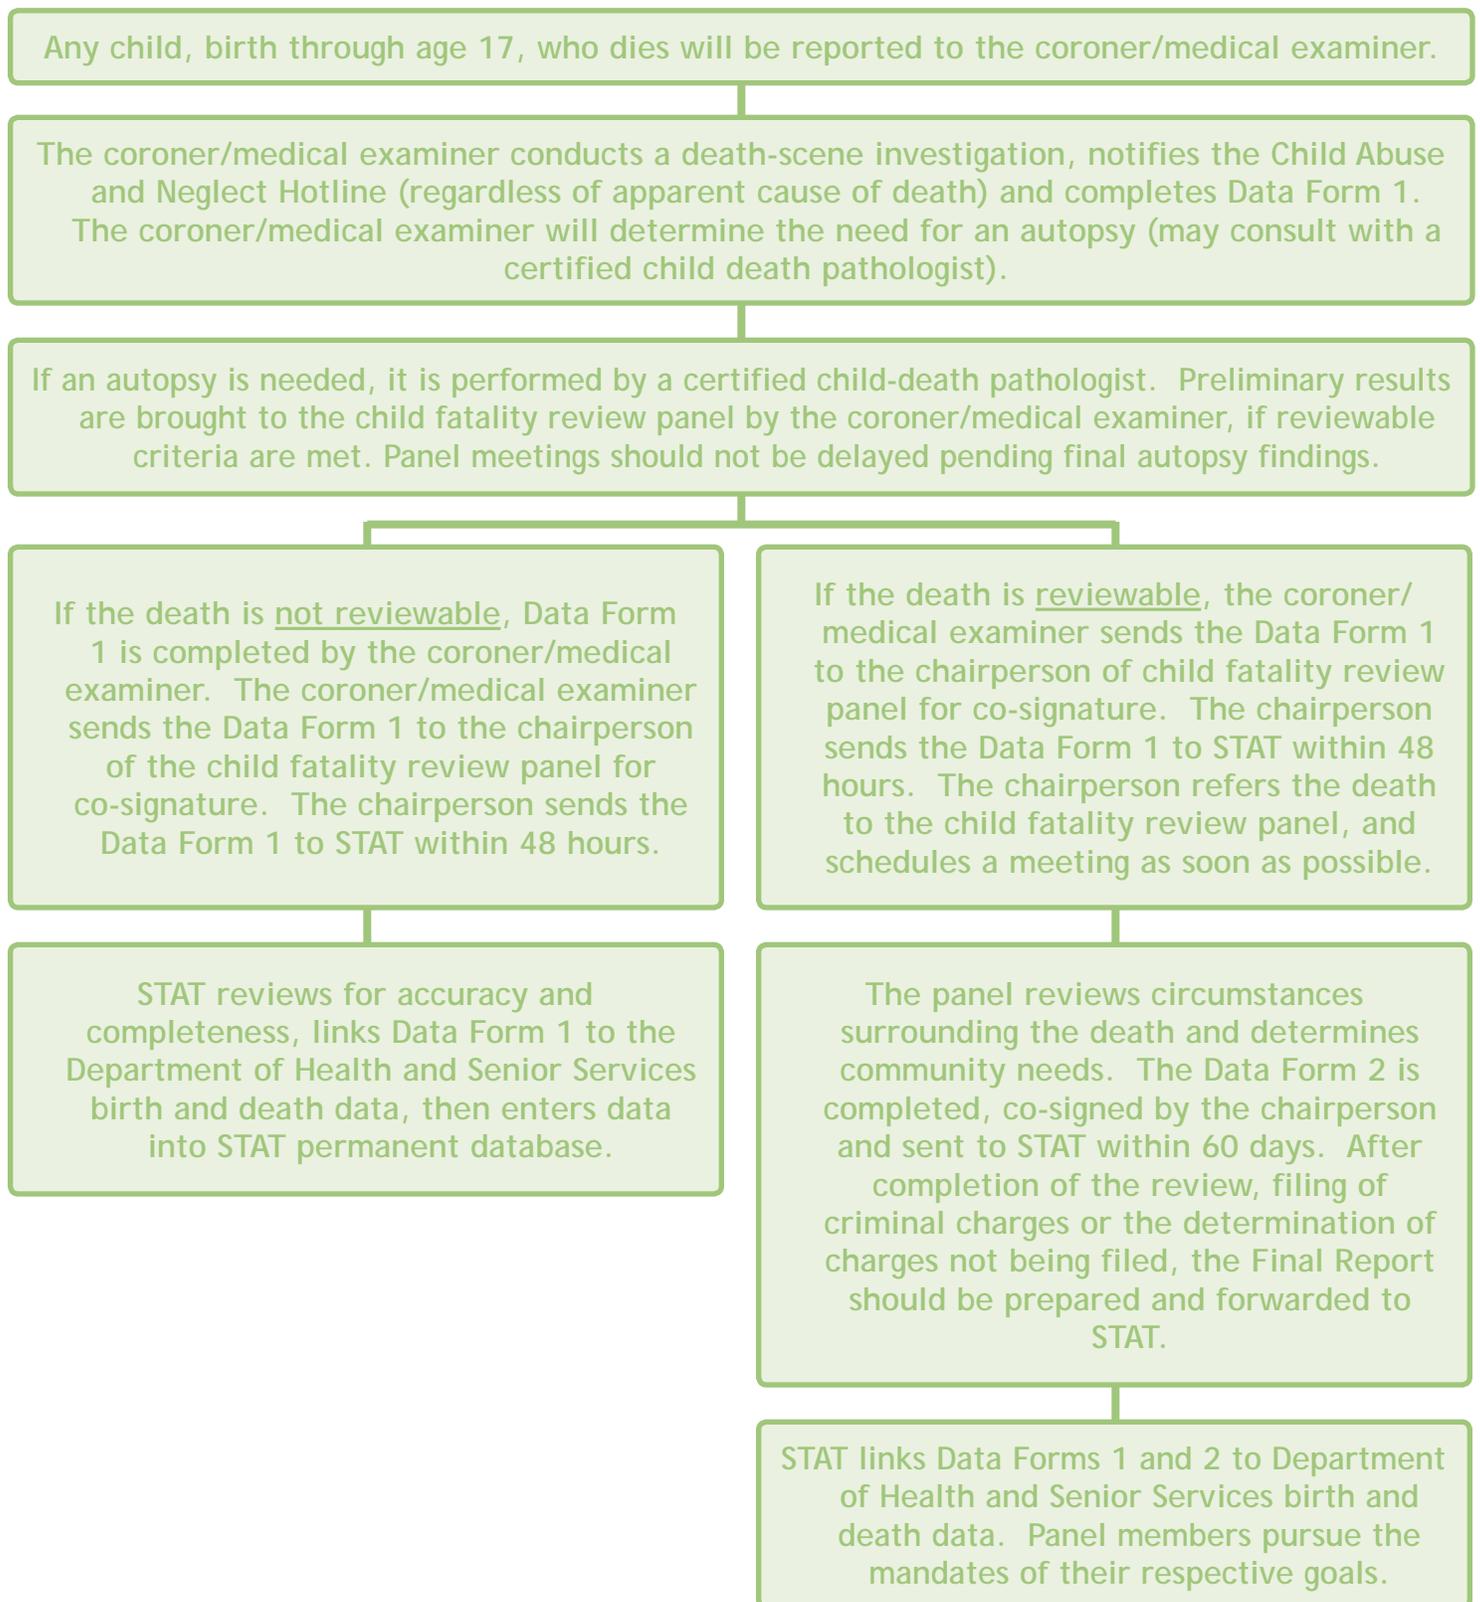

Panels must use uniform protocols and data collection forms.

Certified child-death pathologists must perform the autopsies.

Knowingly violating reporting requirements is a Class A misdemeanor.

When a child's death meets the criteria for review, activation of the panel must occur within 24 hours of the child's death, with a meeting scheduled as soon as practical. A majority of panel members is required to be present (4 or more).

APPENDIX 3. PROCESS FOR CHILD FATALITY REVIEWS

NOTE: Major metropolitan area CFRP panels are supported by Metro Case Coordinators, who coordinate exchange of information between panel members who meet on regularly scheduled monthly meetings, so those panels do not need to follow the above-listed time constraints.

APPENDIX 4. MISSOURI INCIDENT CHILD FATALITIES (AGE LESS THAN 18) BY COUNTY 2008-2010

County of Event	All Deaths			Reviewed Deaths			Injury Deaths

APPENDIX 6. DEFINITIONS OF IMPORTANT TERMS AND VARIABLES

Certified Death:

Death included in the Department of Health and Senior Services, Missouri Center for Health Statistics (MCHS) mortality file, reported by the death certificate.

Missouri Incident Death:

Death within Missouri of a child younger than 18 years. On the basis of data from the CFRP Data Form 1 or Data Form 2, one of the following is true:

- The child died as a result of an injury which occurred in Missouri.
- The child died as a result of a natural (non-injury) cause which occurred, or is assumed to have occurred, within Missouri. (This excludes deaths due to illness or other natural cause which occurred outside Missouri; e.g., a non-Missouri residence.)
- The child was born in Missouri and died as a newborn (within ten days of birth) without having left the state.

CFRP Cause of Death:

Cause of death as reported on CFRP Data Forms 1 and 2. The forms include a category for natural cause which includes congenital anomalies, perinatal conditions, and Sudden Infant Death Syndrome (SIDS), sudden unexpected death and injuries classified by the type of agent or force which caused the injury (i.e., vehicular, drowning, firearm, fall, poisoning). The CFRP provides for an indication of whether or not the injury was inflicted, that is, whether it occurred as a result of the action of another person, without regard to intent or purpose of the action. If the case is referred to the CFRP panel for review, Data Form 2 is completed to report the findings of the panel. The Data Form 2 report includes information relevant to possible child abuse and neglect, and information related to criminal proceedings.

Mortality File Cause of Death:

The Department of Health and Senior Services Mortality File lists cause of death as reported by the ICD-10 code on Missouri death certificates. The ICD-10 coding classification system includes natural causes such as various diseases, congenital anomalies, perinatal conditions and certain ill-defined conditions (which includes SIDS). The injury classification includes those identified as “accidents” (unintentional), those considered intentional (homicide, suicide) and those with undetermined intent. Injury deaths are further classified by the type of agent or force which caused the injury (i.e., motor vehicle crash, firearm, poisoning, burn, fall, drowning).

Mortality File Manner of Death:

Cause of death reported in the mortality file was formatted to conform to the “Manner of Death” variable in a death certificate. This includes six categories based on the ICD-10 code: Natural; Accident; Suicide; Homicide; Undetermined; and Pending Investigation.

APPENDIX 6. DEFINITIONS OF IMPORTANT TERMS AND VARIABLES

Sudden Infant Death Syndrome (SIDS):

Sudden death of an infant under one year of age, which remains unexplained after a thorough case investigation, including performance of a complete autopsy, examination of death scene and review of clinical and social history.

- Morality File SIDS: Death by SIDS, as defined operationally by being reported in the mortality file associated with the ICD-10 code 7980.
- CFRP SIDS: Death by SIDS, as defined operationally by being reported in the CFRP file, from Data Form 1 and Data Form 2, as due to SIDS.

Sudden, Unexplained Infant Death:

Sudden death of an infant less than one year of age due to unexplained cause, requiring the postmortem examination, scene investigation or review of social and medical history. Defined operationally by being reported as sudden, unexplained death on Data Form 1

Reviewable Death:

Death which has one or more applicable indicators for review, as reported by Data Form 1, requiring review by the CFRP panel, whether or not the review has yet been completed and reported. The Data Form 1 report is required for all child deaths that occur in Missouri, and includes indicators of whether a review of that death will be required. If the Data Form 1 indicates a reviewable death, Data Form 2 should be completed after the review.

Reviewed Death:

Death that has been reviewed by a local CFRP panel and reported on Data Form 2.

Mortality File County of Death:

The county, reported in the mortality file, in which the death was officially recorded. May be a Missouri or non-Missouri county.

CFRP County of Death:

The county reported by the Data Form 1 and Data Form 2, in which the death occurred. Only deaths in Missouri are included in the CFRP database.

CFRP County of Incident:

The county reported by Data Form 1 and Data Form 2, in which the fatal illness, injury or event occurred. If the county of incident is a Missouri county, the death is by definition a Missouri incident death. If the county of the incident is outside the state of Missouri, the death is by definition not a Missouri incident death. If the county of death is in Missouri, but the county of incident is not, only identifying information (Section A of Data Form 1) is requested.

APPENDIX 6. DEFINITIONS OF IMPORTANT TERMS AND VARIABLES

CFRP County of Residence:

The county, reported by Data Form 1 and Data Form 2, as the county of decedent's residence may be a Missouri or non-Missouri county. If the child is a newborn, the newborn's county of residence is the mother's county of residence.

CFRP Region:

Location reported by Data Form 1 and Data Form 2, in which the fatal illness, injury or event occurred, formatted to conform to the seven geographic regions defined for the CFRP program.

Children's Division Child Abuse/Neglect (CA/N):

Death for which the Children's Division reports a *preponderance of evidence* finding for child abuse or neglect. *Preponderance of evidence* may result from a Children's Division investigation or court adjudication. Abuse refers to physical, sexual or emotional maltreatment or injury inflicted on a child, other than accidentally, by those responsible for the child's care, custody and control. Neglect refers to failure by those responsible for the child's care, custody and control to provide the proper or necessary support, education, nutrition, medical care or other care necessary for the child's wellbeing.

CFRP Fatal Child Abuse and Neglect:

Child death resulting directly from inflicted physical injury and/or negligent treatment by parent or caretaker, regardless of motive or intent.

Mortality File Child Abuse/Neglect:

Death for which the ICD-10 code in the mortality file indicates abuse or neglect. These abuse/neglect deaths are usually under-reported relative to those by the Children's Division as substantiated child abuse or neglect.

Mortality File Homicide Death:

Manner of death due to homicide, as reported by ICD-10 codes X85-Y09.

Mortality File Suicide Death:

Manner of death due to suicide, as reported by ICD-10 codes X60-X84.

Mortality File Autopsy:

Indication from mortality file that decedent was autopsied.

CFRP Autopsy:

Indication from CFRP file that decedent was autopsied and how the autopsy was paid for.

APPENDIX 7. DEATH CERTIFICATE MANNER OF DEATH

(Summarized from: *A Guide for Manner of Death Classification*, draft presented to the National Association of Medical Examiners, September 24, 2001, prepared by Randy Hanzlick, M.D., John Hunsaker III, M.D., and Gregory J. Davis, M.D.)

All states have a standard death certificate that is based upon a model certificate called the US Standard Certificate of Death. The *certifier of death* is the physician, medical examiner or coroner who completes the cause of death section of the certificate that also includes details about the circumstances surrounding the death. Manner of death is one of the items that must be reported on the death certificate and a classification of death based on the circumstances surrounding a particular cause of death and how that cause came into play. In most states, the acceptable options for manner of death classification are: Natural, Accident, Suicide, Homicide and Undetermined.

The death certificate is used for two major purposes. One is to serve as legal documentation that a specific individual has died. In general, the death certificate serves as legal proof that the death has occurred, but not as legal proof of the cause of death. The second major purpose of the death certificate is to provide information for mortality statistics that may be used to assess the nation's health, cause of morbidity and mortality, and developing priorities for funding and programs that involve public health and safety issues.

Manner of death is an American invention. A place to classify manner of death was added to the U.S. Standard Certificate of Death in 1910. It was added to the death certificate by public health officials to assist in clarifying the circumstances of death and how an injury was sustained - not as a legally binding opinion. In general, the certifier of death completes the cause of death section and attest that, *to the best of the certifier's knowledge*, the person stated died of the cause(s) and circumstances reported on the death certificate. Information on the death certificate may be changed, if needed.

There are basic, general "rules of thumb" for classifying manner of death.

- Natural deaths are due solely or nearly totally to disease and/or the aging process.
- Accident applies when an injury or poisoning occurred without intent to harm or cause death. In essence, the fatal outcome was unintentional.
- Suicide results from an injury or poisoning as a result of an intentional, self-inflicted act committed to do self-harm or cause the death of one's self.
- Homicide occurs when death results from a volitional act committed by another person to cause fear, harm or death. Intent to kill is a common element, but is not required for classification as homicide.
- Undetermined is used when the information pointing to one manner of death is no more compelling than one or more other competing manners of death, when all available information is considered.

In evaluating the manner of death in cases involving external causes or factors (such as injury or poisoning), injuries are often categorized as "intentional" (such as inflicted injury in child abuse) or "unintentional" (such as falling from a building). Intent is much more apparent in some cases than others and it is often difficult to assess a victim's or perpetrator's intent. The concept of "voluntary acts" or volition is helpful. In general, if a person's death results at the "hands of another" who committed a harmful volitional act directed at the victim, the death may be considered a homicide from the death investigation standpoint.
